Hi all,

Was wondering if some one out there has the answer to a few questions.

1. I am currently using multitos (AES 4.0 + MiNT 1.09 [+ net patches]) and
was wondering if anyone was able to get the WF_NEWDESK feature of loading
an alterante OBJECT_TREE for a desktop background to work. It is documented
in the Atari Compendium, but I was not able to get it to work.

2. Anyone know the status of AES 4.1, it seems to have a few new features,
namely: arbitrary Speedo fonts for the system fonts, and Iconization, that
actually put GEM in the class of other window systems. I have not heard of
it being out, or even a possible release date?

3. I also currently have Atari Works 1.2 + a coupon for a free upgrade,
is there a newer version out?

Thanks in advance for any information.

Cheers,
Scott Kolodzieski
scott@dmi.stevens-tech.edu

2. STacy

Newsgroup: comp.sys.atari.st.tech

From: jperez@Hawaii.Edu
Message-ID: <CIxwzF.69F@news.Hawaii.Edu>
Source record: 35386

f
dfI got a STacy 4 a while ago and I really would like to get the darned screen to brighten up a bit. Is there anyone out there than knows how to modify the voltage regulation to the screen light so it will be visible in a lit room? The voltage that is going to the screen seems to be AC so I therefore have NO idea what to do.
Drop me E-mail if you have any ideas... Also, can I replace the Stacy screen with a brighter or reflective one?

borg
jperez@uhunix.uhcc.hawaii.edu

PS - Stacy owners, Fast Technologies makes a special Stacy version of the Turbo25 accelerator! Anyone out there installed one?

3. Re: Questions About TOS 1.0 and HDs

It was none other than Terry Moffitt that wrote on the 24 Dec 93 that ,

TM> OK, so what version of TOS should I go for ? I notice some people
are
TM> saying
TM> that you should upgrade to 1.4, but I see magazines advertising
TM> version 2.06 with a switch for switching back to your old version
TM> (which I think might be useful for some things). I'd be willing
to
TM> part with 65 UKP for the 2.06 upgrade, but is this the best way for
me
TM> ?? How much is a 1.4 upgrade and where in the UK could I get it
??

Go for TOS 2.06 IMHO .You can get a plug in board these day's ... no soldering
for around what you are willing to part with. Whilst TOS 1.4 will
certainly solve most of your problem's ,TOS 2.06 will solve all of them .

LR> Same here. I have been using FATSPEED with TOS 1.2 for months. I
LR> can never go back to using my ST without it!

Yes but there is more problem's with >1.4 than just that . TOS1.4 upgrade
is dirt cheap and improve your life immensly. Even 1,4 though has limitation's
and IMO an upgrade to TOS 2.06 is money very well spent.

6. VDI call in HSC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-01 15:40:30 UTC
From: vicb@clark.edu
Message-ID: <2g45he$i2e@clark.edu>
Source record: 35387

Can anyone help me? I want to re-define the fill pattern used by the vsf_interior() call. I'm using HSC 1.4. The problem is that the call vsf_updat() doesn't seem to exist on this set of bindings, or at least not by that particular name, anyway. My documentation is limited, and I don't know how to make a generic VDI call (or what the designation for this particular routine would be).

Can anyone shed some light on this for me, and on how to get around it?

Thanks in advance,
Victor Bruhn
vicb@clark.edu

7. Idea: 68010/10 in Atari ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-01 19:11:09 UTC
From: psthomas@nyx.cs.du.edu
Message-ID: <1994Jan1.191109.15126@mnemosyne.cs.du.edu>
Source record: 35388

I just had the thought (after putting my AT&T PC7300 through its paces yesterday), that it might be kind of interesting to put a 68010 in the ST, and maybe even bump the clock speed up a bit (to 10 MHz). Would this be possible, or worth doing? I unfortunately have very little knowledge of the ST's innards, so I have no idea if/how it would work, or how it could affect other components. Any ideas? At least I'd be able to use those four or five extra breakpoint instructions on the '010... :-) I think it'd be more for the sake of exercise and curiousity than for performance.

> Sorry, no bollocks. The problems are there, no doubt about that, and
> are perhaps the source of your implied "minor" problems...?

Minor as in problems you would experience running a HD on any TOS.

Like when I lost D: the other day because the program I used wrote some files
to a BGM partition when the program obviously (now) didn't support BGM
partitions.

> The situation with TOS 1.0 nd 1.2 depends rather a lot on what you do
> with your
> system, how long it's on between resets (or power-off), and what

My ST has been on almost every day for the last 2-3 years, and once I switch it
on it stays on till I go to bed. This includes running my point system every
day which includes a fair amount of disk i/o.

> "fix-programs"
> are used. Minimum should be FOLDERxxx.PRG when using a harddisk, since
> this reduces the risks by increasing the statistical time before the
> system gets confused with 'many' folders being 'opened' in the course

> makes access times much more acceptable for the user.

Exactly, FASTPEED plus FOLDRxxx.PRG/ICD HD driver makes a TOS 1.0/1.2 ST easily
as useable as a 1.4+ ST.

Why would I lie about this if this is how I've been running fine for the last
2-3 years.

New Year Greetings, -Paul-

>On norwegian (based on German) keyboards the brackets are on

Make that Norwegian, Danish and Swedish keyboards. Someone here (a swede?) said that the Swedish keyboard was similar to the English keyboard. That's wrong. It's much more like the German keyboard (only five keys differs, and two of them are the Y and Z wich are switched (Yeah QWERTZ on german machines))!
Anyway, Atari only made a Norwegian keyboard for the TT and The MSTE. All other ST's got some keycaps replaced after they arrived in Norway.

I beg you programmers to use ASCII (case insesitive!) values and check the ALT/SHIFT status to make up keyboard shortcuts!

I guess this was real usefull information for all of you out there! :-)

Happy new year anyway!

11. Modem1 port not working on TT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-02 03:14:48 UTC
From: ypelletier@cmc.aes.doe.CA
Message-ID: <CIzFop.42t@cid.aes.doe.ca>
Source record: 35143

Hi folks,

I usually connect my modem through the modem2 port, using Stalker.
A few days ago, however, I needed to use Kermit, so I reverted back to
Uniterm. Of course, Uniterm can only talk to the modem1 port, so I
switched my modem cable accordingly (with the power off, of course).

Problem is, my modem1 port seems to be dead. I don't know when and
how it happened, but no output goes through, no matter what I try.
I have tried various software combinations and serial settings,
used a different serial cable, all to no avail.

One thing I tried in a shell under Multitos was:

cat textfile.txt >\u:\dev\modem2

This, as you would expect, dumped the contents of textfile.txt into
my Stalker window. After that I changed the cabling and Stalker
settings to modem1 and did:

cat textfile.txt >\u:\dev\modem1

this simply resulted in tying up the computer. No output. Nada.

It looks to me like some chip in the serial interface got fried.
In every other respect, the computer is performing normally.

So my question is: given these symptoms, could anyone suggest a course
of action? I would also be grateful for any information about the
makeup of the TT's serial ports, like chip numbers, schematics, etc.
I would much rather repair this myself as I suspect it might be a
fairly benign problem. (I can handle light electronics jobs, and for
heavier stuff, one of my friend is a good soldering iron jockey).

Thanks in advance, and all the best for the New Year!

I think that someone tried it, when they found one that was pin compatable with the 68000, the resultant speed up was about 1% It would be interesting to see what would really happen with a faster 010.

It was none other than Paul Civati that wrote on the 31 Dec 93 that ,
PC> Well 1.2 works fine for me. I just get annoyed when people say 1.4<
PC> and HD is a disaster when I've been running fine for 2-3 years.

Not strictly true though,Paul ,since haven't you just recovered a HD
crash.
Corrupted FAT I think you said. Now this may not have been directly
caused
by TOS1.2 but the fact that it was a BGM partition is indirectly the
result
of TOS1.2's 16Mb partition limit and I beleive you attributed it to
that.

PC> Move files, keyboard reset and rename folders are all added
features,
PC> I don't need to set step rates and if I did there are probably
plenty
PC> of PD programs to do it.

Agreed ,you can add all those features using 'TOS modular extension's' to
borrow a phrase from Apple user's :-) but some features cannot be
realisitically patched ,e.g. Installing Application's ....on TOS 1.2 it simply
doesn't work ,even on 1.4 it is a bit hit and miss.I wouldn't go as far as to
say that it is a disaster to run a HD on old TOS but you certainly are missing
out on a hell of a lot you could have if you did
upgrade.

PC> I am a student. Also difficult to find 2 chip sets of 1.4, which
PC> means 'rejigging' some of the ST to accept a 6 chip set. Then you
PC> have to run new patches for any new bugs added in 1.4 (no I can't
PC> offhand remember what they are).

Exactly ...go for the TOS 2 plug in a go IMO .... and then you don't
need
any patching.... even SerialFX I have heard (But I still use it
myself)

The modem1 port on my TT works fine without MultiTOS installed, but
with MultiTOS, it always locks up the computer, so you may not have
a fried chip.

16. question regarding program in "Compute's Atari ST Machine Lang"

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-03 05:03:00 UTC
From: winters@access3.digex.net
Message-ID: <2g88u4$t94@access3.digex.net>
Source record: 35146

Been fooling with programs in Compute's Atari ST Machine Lang.
Programming Guide by Simon Field (copyright 1987). Pg. 201 has
sprite drawing program example. When using Devpa ST assembler to
try and assemble this program, got addressing errors. Did notice that
_x and _y were not defined, so defined them.... Still getting some
assembly errors - if anyone has worked out of this book and with this
program, would appreciate contacting me - do THINK I noticed differences
in assembling this program in DEVPACST assembler and AS68.PRG.... :-)

From: mforget@elfhaven.pucnet.com
Message-ID: <H.ekK.SlJsI&Dk_BI@elfhaven.pucnet.com>
Source record: 35236

Hello,

The news system was not working the last time I posted this, so the message never got out.

I am looking for a TT/Falcon user (with MultiTOS/memory protection) to test the new version of MasterBrowse. Once I know that the program will run on the Falcon/TT with the low-level changes I have made, then I can go ahead with my other plans to _really_ improve the program. The beta-testing (at first) would simply consist of running the program, and following a very short checklist.

Beta-testers receive a FREE, registered, optimized, personalized version of MasterBrowse (as well as some other programs) VIA electronic mail.

If you want to do this (and it would _really_ help me out) then just reply to this message and say so. BTW, I will of course be happy if more than one user replies (the more the merrier -- up to a point)...:)

I got a patch (probably from atari.archive) that is called HD_FDC.PRG in
its uncompressed form and works quite nice. I've been using it for quite
a longe while now and never had any problems with it. It sits in the
AUTO folder and runs directly after my BootSelector and before anything else.
(It works together with all sorts of vector benders (digivec,beep, ...)
and even works fine with MiNT running after it. (I never checked if MiNT
actually needs it, but ...).

Hope you get a working patch, the 2ms noise is not nice.

Michael

20. PT_SRC3T now available at your favorite site

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-03 09:49:18 UTC
From: d3marten@dtek.chalmers.se
Message-ID: <d3marten.757590558@dtek.chalmers.se>
Source record: 35150

PT_SRC3 goes TRASHY .....

I have uploaded my new version och PT_SRC3 and since I have
added TRASH mode it's called PT_SRC3T.lzh and I have uploaded
it on following sites:

ftp.uni-kl.de
athene.uni-paderhorn.de
faui43.informatik.uni-erlangen.de

What is PT_SRC3T then ?

The archive PT_SRC3T.LZH contains the full sourcecode for a
TRUE 50kHz replay routine every effect in PT2.2 supported.
The new in this version is TRASH mode which is a really useful
technique. It's good since you don't have to count on the
replay's maxtime (which in case is somewhere around 34%
(sigh,it's too much)) but on the mean time it takes (which in
this case is 26%-28%).

Bugs (NO!!) , Suggestion , Questions , DONATIONS :-) , your
girlfriend have breaked up with you and you need someone to
talk to , or whatever then mail:

>>> d3marten@dtek.chalmers.se <<<

That's all folks

The 68010 speeds up some operations but needs a modern TOS.
(There are some operations privileged on a 010 which weren't on a
68000)
You can't use the 010 at 10 Mhz without cache and a cache would
slow down the processor.

If you really need a speedup look at the PAK/3 from the
C't magazine.
You get a 68020 / 68030 with 16 or 32 Mhz, cache, 32 Bit ROM
on extention board.
(And 16 Mhz 68020 are really cheap today)

Message-ID: <2g8u6q$fqj@fuhainf.fernuni-hagen.de>
Source record: 35152

I have a problem using my SLM 804 with GhostScript. Under TOS2.06 all works fine.
Using MultiTOS I get no Output.

Using MidiCOM I get no Output, even after having stopped MIDICOM!

Can anyone help me ?
Andreas.Schrell@FernUni-Hagen.de

23. Disk error handling

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-03 12:38:29 UTC
From: ga@mrih.no
Message-ID: <2g93k6$lh5@ugle.unit.no>
Source record: 35153

I have seen some programs that take over the disk error handling itself, so that you loose the "Drive A: is not responding" GEM alert box. Since this actually causes a crash in Scriba (Scriba looses the ROM keyboard routine, remember?), I'm very keen on finding the vector(s) to take over this error handling myself. Any help would be appreciated...

24. How to auto-exec a GEM program?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-03 15:38:56 UTC
From: duchene@9-800.frec.bull.fr
Message-ID: <368@vercors.frec.bull.fr>
Source record: 35071
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'd like to run a GEM program at boot time (as are run programs in the
auto folder). I have read that newer versions of TOS can do that but
I have got a MegaST2 TOS 1.2.

I have been told that AES was not started when executing programs from
the auto folder, so this should not be the right place. (Perhaps is there
a way to easily start the AES ?)

I have tried to run the program using a Pexec call from a very simple desk
accessory I have written, but this failed... The program didn't execute and
the accessory didn't work any more: I got the desktop without its menu item.

Any ideas?
Thanks in advance for your help!

25. Alternate Combinations for Foreign Languages

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-03 15:58:36 UTC
From: avg@cwi.nl
Message-ID: <CJ29po.81A@cwi.nl>
Source record: 35154

In guidelines recently set by Atari it is recommended NOT to use
Alternate + letter key shortcuts, because, these documents say,
those combinations are reserved for letters which are not accessible
from a standard Atari keyboard, like the french C cedille and German
umlauted letters.

Is this true? The reason I doubt this is that it is in fact German
programs which tend to use Alternate + letter shortcuts in dialogs,
while I expect that in Germany one wouldn't like to lose the possibility
to type umlauted letters.

How do other GEM programmers attack the differences between various
international keyboards?

Is it true that a combination Control -] (closing square bracket)
does not make sense on a German keyboard?

I find this VERY strange, since ALT+letter on the desktop (made by Atari, remember?) actually has a function: to slam up a new window as if you had double clikced the drive with the given letter. I haven't checked forms and programs during runtime, but most GEM software uses the ALT + letter combinations for functions, whilst ALT+numeric keypad tends to work as on the PC; you get the character you enter the ASCII of.

Oh thank you very much Graham. ;-(

On TOS 1.4+ that limit is increased to 32mb so the problem would have occured
on any TOS with a BGM partition.

Does C't sell these gadgets already put together? Is the
magazine, or any hardware I hope that they sell available in the US?
Does it have an MMU socket? Since I use GCC alot, I would rather have
floating point support than general speedup. Does anyone know of an
very inexpensive way to upgrade an st to 68881 + tos 2.06? I seem to
remember something called a tos adapter board that only cost $20.

Yes.

aA> programs which tend to use Alternate + letter shortcuts in dialogs,
aA> while I expect that in Germany one wouldn't like to lose the possibility
aA> to type umlauted letters.

Well, they carefully omit the ALT+char combination that is needed to
produce the german characters. Actually, the international characters is
mostly available directly without having to press ALT. But other important
characters like [|]{@} etc. is only available by pressing ALT+some
international-character-key.

aA>
aA> How do other GEM programmers attack the differences between various

Try to use CNTRL+char as much as possible, instead of ALT+char.

aA>
aA> Is it true that a combination Control -] (closing square bracket)
aA> does not make sense on a German keyboard?

Atleast it might make no sense. On my Norwegian keyboard, you will have to
press alt + umlaut('U') to produce]. Thus Control -] will actually become
Control - Alt - umlaut('U'). (Which sometimes works, sometimes not,
depending on how the gem-program checks for the Control/Shift/Alternate
keys.

It is true to some extent. I live in Sweden, and have a swedish
keyboard on my 1040STfm.

A swedish keyboard is slightly different than an english one. Some of
the keys are exchanged for keys with swedish letters on them. To get
at for example [and], we have to use Alternate and a key. But as far
as i know, there should be no problem using Alternate + letter if this
letter is international (belongs to the english alphabet.)

Something you do however see quite often (too often) is games and
programs using the scancode of a key instead of it's ASCII value.
This is most annoying, as different countries have different keyboard
lay-outs. (The french keyboards begins with ASERTY instead of QWERTY,
for example).

I can only speak for the Swedish keyboards, and here a combination
like Control + [is quite hard to get at. If not impossible. But
Alternate + letter of the english alphabet is no problem. Just don't
use the scancode...

Hope this helps some.

/Viktor....

The best approach (apparently) is to ignore the 'ASCII' character in
the low byte of the keyboard code returned by evnt_multi() et al. The
upper byte, the scancode should be used as an index into the arrays
returned by Keytbl(). Anyone know exactly why?

Some scancodes appear to be wrong, for instance the ALT-top row. (ie
Alt = and Alt 3 etc). But, without knowing all the possible
variations, it is hard to know exactly which are wrong, and which are
(eg) Compendium typos.

Can I propose that people mail in complete tables of the scancodes for
their nationality keyboards/machines together with the corresponding
key labels? A list of the Keytbl return arrays would also be useful.
```

If anyone is interested, email me. I can submit the UK TOS 1.04 entry.

39. Mac Warehouse Modems and my MSTE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-04 10:19:48 UTC
From: hsp4@namaste.cc.columbia.edu
Message-ID: <2gbfs4$1r1@apakabar.cc.columbia.edu>
Source record: 35164

Having finally realized that 2400bps really sucks, I just bit the bullet
and called MacWarehouse and picked up one of their $99 modems. I was
lucky enough to have gotten connected to their PC side, so it's configured
for a PC. However, I want to be aware of what kind of issues I will
be facing when I connect it to my MSTE at school (4MB, Tos 2.05, SM124,
DD drive). The key issue is that I'm using STraight FAX--not the most
current version, though, and I need to be able to count on it. I have
no problem with getting an upgrade, if necessary. I do, however, have
a problem with not being able to send/receive faxes...

Thanks in advance for your assistance.

You want to take over the critical error handler, which is pointed to
by one of the system variables. I've never done that, but the
Compendium (sort of) documents how.

What's Scriba, and why doesn't it use the AES?

Another one - French users need to use the shift key to get the main
keyboard numerals.

Maybe there should be a set of 'usable' keyboard shortcuts around
somewhere, so no-one locks-out some nationalities.

I don't have that - which is why I post here for that info. *grin*

> What's Scriba, and why doesn't it use the AES?

Scriba is a diskmagazine which uses ROM only for memory allocation and disk
access. Should work on all systems that can display an ST compatible screen
resolution. Check it out at atari.archive.umich.edu in the folder
Magazines/Diskmags/Scriba

43. NVDI compatibility problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-04 12:44:34 UTC
From: djs@jet.uk
Message-ID: <1994Jan4.124434.5853@jet.uk>
Source record: 35168

I thought I would see fewer compatibility problems when I sold Warp9 and got NVDI. But:

1) MiNT got very unstable if loaded after NVDI. I now have the latter after MiNT in the auto folder, so it is run by MiNT rather than by TOS.

2) MIDI bios routines fail under certain conditions. Perhaps this is down to the built-in mouse accelerator? (I also used to have similar problems with MiNT/Maccel).

3) Whatever my configuration, microEmacs v3.10 crashes on exit when NVDI is running. I have TOS compatibility enabled. Any ideas (other than to use a different editor, of course).

4) tcsh crashes from time to time. Although it is not obvious why NVDI should affect it, it crashed much less often previously.

These are *not* wrong. The ALT-top row is defined to have these
scancodes. There are more special cases, like CTRL-cursor left/right
and CTRL-home. They are defined by the VDI standard keyboard codes.

> more for the sake of exercise and curiousity than for performance.

I have got a STF with 68010 at 8 Mhz and a TOS 2.6.
It works fine with a patch cause of a ROM bug:
The ROM find a 68010, but execute a `movec cacr' when a NEWDESK.INF
is loaded by the DESKTOP (???). But the memory cache exist only
since the 68020.
My patch modify the illegal exception, and `RERUN' after the `movec'.

A 10 Mhz 68010 is a bad solution, because of SHIFTER conflicts.

Problems: the Pure Debugger don't accept the 68010...

MiNT works very well...

For fun, with the 68010, I have emulated DMA sound !!!

Performances: I win 15% only for div/mul ;-) , now I work on virtual
memory not possible on a 68000.....

With a 68020/30/..., there are less compatibilities problems...

hello. recently our rather ancient sh 205 hard drive assembly (the one with the same case as a mega ST) died. the drive inside is a tandon TM262 20 meg and it sounds like it's turned the drive platters into metal filings.

anyhow i managed to find a TM262 locally, but my boss was wondering if one could just as easily drop in a larger MFM type drive into this chassis. manufacturer numbers and sizes would be appreciated too...

thanks in advance

Well, *with* Geneva you can't do more than get lost either. Ideas are nice, the way they are implemented is horrifying.

>remember?) actually has a function

Well, ATARI is there to define standards and not stick to them. The
MultiTOS desktop (basically a quick re-write of the TT desktop) doesn't
implement the keycode guidelines at all (i.e. control-o for open,
control-w for close, etc.) I guess nobody actually uses NEWDESK. TT
users tend to get Gemini (and recently 2.0 for MultiTOS) or similar
programs, while old ST owners will have to do with the 1.0 desktop---so
who cares.

Well, we all know the proper way (or AN appropriate way, rather) is to
get the scan code, check for the alternate key, and then use Keytbl()
to get the ASCII code for the letter from the scan code.

If I get the rest of your story right, it would be annoying to you if
an entry in the menu bar would read:

Expand Tabs ^]

(for you don't have a key that says ']', and the Keytbl entry would
probably be a Swedish character as well).

What non-alphanumerical keys are NOT used on international keyboards?

I guess <
>
.
,
;
:
'
"
\
|

are all OK, are they? Then again, hypothetically speaking, if I had

Shift Right Shift Control >
Shift Left Shift Control <

Then people with an Americain keyboard would get confused, because for
them, < and > are on the same key, so only one of the codes would actually
require shift.

How about Ctrl + digit and Alt + digit? These are frequently used
combinations. If an application uses the Keytbl() method, they'd probably
have to press shift as well.

>Maybe there should be a set of 'usable' keyboard shortcuts around
>somewhere, so no-one locks-out some nationalities.

What I would like to see is plainly all key tables currently existing
for ST, TT and Falcon systems. Then I'd analyze them and see what codes
I can get safely with the following routine (i.e. the 1 I'm currently
using)

(not sure about the exact format of the Key Table and the Keytbl() call)

```
int alt_ascii
( int k_code
, int k_shift
) { int upper = k_code >> 8
; int lower = (char) k_code

/*
// Don't accept codes that actually produce something visible
*/
; if (!(k_code & K_ALT) || lower >= 32) return 0

/*
// Take the ASCII value from the appropriate Key Table
// Depending on shift status
*/
; if (k_shift & (K_LSHIFT | K_RSHIFT))
return (Keytbl()->shift[upper])
; else
return (Keytbl()->unshift[upper]);
}
```

>Can I propose that people mail in complete tables of the scancodes for
>their nationality keyboards/machines together with the corresponding
>key labels? A list of the Keytbl return arrays would also be useful.

Can I propose you all send the tables to me? I will then post them to
comp.sources.atari.st (I will soon be the moderator of the sources and
binaries groups) in a nice, readable format, with some extracts of the
current discussion, and pieces of code for reading key combinations.

So what we need is all the values the function Keytbl() returns
for values 0 up to 127 for unshift, shift and, I forget what the third
one is, alt or control. Does anyone have a smart idea about formatting
the data?

I guess they're not Compendium typos, but blatant design failures by
Microsoft. The Atari keycodes were derived directly from the GEM key
codes which are MS-DOS codes.

Yes. On non-US keyboards, characters like []{} etc. are accessed with
ALT or even ALT-SHIFT. Depending on the way your application looks
for combinations like Ctrl-] it will never detect these `keys'.

If you want to be on the safe side, restrict your key codes to
CTRL-A til CTRL-Z and ALT-A til ALT-Z.

>>umlauted letters.

On a German ST keyboard, the umlauted letters are accessible without the pressing the alternate key. There are some characters that are normally accessible on English keyboards, but are produced by some alt-umlaut combination on a German keyboard:

[is alt-oe (i.e. Alternate + the umlauted O key)
] is alt-ae
@ is alt-ue
{ is alt-shift-oe
} is alt-shift-ae (ask me how that sucks when hacking C...)
\ is alt-shift-ue

>Something you do however see quite often (too often) is games and
>programs using the scancode of a key instead of it's ASCII value.
>This is most annoying [...]

This is annoying indeed (I once had an AZERTY mod player and editor). However, in conjunction with Alt-combinations, no ASCII-code is produced, unless the key has some ASCII code mapped to it's Alt-version, such as the German umlaut keys have. For example, try the following program in GFA:

```
REPEAT
x%=EVNT_KEYBD()
PRINT HEX$(x%,4)
UNTIL (x% and &HFF)=17 ! exit when ^Q is pressed
```

You'll find that pressing Alt-S, or other normal letters in conjunction with alternate, returns the scancode of the key in the high byte, as evnt_keybd() always does, and 00 in the low byte. Perhaps that's the real reason why Atari discourages using alt + letter combinations as shortcuts.

I have an Atari 1040STfm with 4Meg Ram, 16MHz Adspeed CPU, 720K floppy, monochrome monitor, and 60Meg harddrive. I've had the system for many years and it works (apparently) flawlessly.

Recently I have discovered that behavior I thought was normal, is actually abnormal, and I was wondering if others can help me diagnose the problem.

There are two symptoms that I found are abnormal:
1) I use Dr. T's X-OR and have had Sysex problems with large VFX bank dumps. I recently added the ADSPEED CPU and the problem disappeared. Other people seem to think I should not have had the problem.
2) I use Diamond Back II for backup. It takes me about 8 hours to backup 60 Meg compressed onto about 40 floppies. Other people have told me that it should only take about 2 hours. Most of the time is spent in the compression operation.

In short, then, my impression is that I have (and have always had) an Atari that seems to act slowly in certain ways, perhaps it gets flooded with interrupts under certain conditions. This would explain the MIDI problems and perhaps the extraordinary time spent in DBII file compression.

QuickST indexes show that the raw CPU operations are normal for a 16MHz 68000, and to my eyes, all file I/O is rapid, and programs seem to run well. I don't have a second Atari for comparison and I don't know anyone personally nearby who has an Atari that I could borrow for comparison.

I do have a 1040 Service Manual, good hardware skills, and I could probably figure out at the hardware level if something abnormal is happening if I had a clue of where to begin.

I don't have any real problem with my system, as I have lived with it like this for a long time, but my curiousity is aroused, and if I can pick up some extra CPU cycles without much trouble I would like that very much.

Anyone else have ideas or comments on this?

Thanks.

{I have fairly normal accesories and auto folder files: Codehead stuff like multidesk, hotwire, maxifile, and warp9; edhak; the standard fixes: foldrxxx, dcache, poolfix, serialfix, etc. Of the 4Meg, over 2Meg are available at all times for program use}

Oh, I recently got a newsletter from Gribnif with nice offers and information about amongst others, Geneva.
I am surprised you didn't get this newsletter. I even live in the Netherlands so where one lives can't be of any concern.

(let's hope this works (first time VNEWS user :)

I just recieved a Stacy Battery Pack from Best Electronics and I can't figure out where to put it. I am supposed to install it on a 2-pin male connector on the main board, but the only one that I can find has the power switch plugged into it. Does anyone out ther have a Stacy with a battery pack? Help!!!!

IMHO the only sollution to this is not to use Control + key or Alt + key with anything but international letters. All special characters, like < > , . : ; - _ + ? have different placements in different countries, and this could cause the kind of confusion you mention.

Perhaps there are other keys that are safe, but that is highly unlikely. I have seen at least three or four different layouts, and from what i recall the characters < > , ; . : - _ + ? ' * ~ ^ { [ ] }, and , come to think of it, ! " # $ % & / ( ) = all have more or less different placements.

This is a rough picture of a Swedish keyboard. The blank keys have swedish characters on them, and these are not viewable in large areas with 7-bit newsservers, so I left them blank. In real life they have characters on them.

The {[}] and ~` keys have Swedish characters. We get to those six ( {[]}~`) characters with use of Alternate or Alternate+Shift.

```
Esc ! " # $ % & / ( ) = ? * Backspace
1 2 3 4 5 6 7 8 9 0 + '
{ } Re
Tab Q W E R T Y U I O P [ ] t Delete
u
~ r |@
Control A S D F G H J K L ` Return \^
> ; : _
Shift < Z X C V B N M , . - Shift

Alternate Space Caps Lock
```

This isn't a very clear way, but it shows some differences. ; for example.

But it is a hard-to-solve problem. Perhaps Atari should release a booklet containig all of the national layouts, so that programmers could use the country code in ROM to choose a different Alt+key for some countries? Seems like noone would use it anyway, though. To much work :-)

/Viktor...

>
>Hope you get a working patch, the 2ms noise is not nice.

Actually, it's not a "2 ms noise" but a "6 ms noise"... :-)

The TOS 2.06 BIOS doubles the FDC's clock when it thinks that a
HD disk is inserted; since this results in _halving_ the real
step rate, the FDC is told to _double_ the step rate in order to
compensate for this.
Unfortunately, the clock doubling cicuitry simply isn't there on
non-MegaSTEs, so the resulting step rate is *wrong*...

SEEKUP.PRG simply changes the BIOS' initial density setting from
"HD" back to "DD" (by hacking an undocmented internal variable) - the
BIOS only changes this setting after a disk error or after a Flopfmt()
call...

66. Color icons

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 00:31:46 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Jan5.003146.22472@beaver.cs.washington.edu>
Source record: 35188

How can I tell if the TOS can handle color icons? I can't just check the TOS version, because you can have color icons in MultiTos on a TT with TOS 3.06, but 3.06 doesn't support color icons, while multiTOS does.
Checking for Falcon is easy with cookie.

Need some check that it specific to icons...like checking desktop tree for a 33 object type, but I don't know the address of the desktop tree...

Isn't there an easier way?

Need help, Thanks!

From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Jan5.003838.22805@beaver.cs.washington.edu>
Source record: 35192

Is there a system command (NOT HARDWARE REGISTERS) that I can use to play DMA sound and I can call (one command) that will work on STE, TT, and Falcon? I don't want to have to write to any hardware registers because then I would have to check which particular machine I was on, not just whether _SND was supported. I also want to be compatible with future computers.

I'll need the XBIOS/VDI/AEO command number for whatever it is. I'm coding it in machine language so I'll need this number. Thanks.

68. falcon, dsp, programing, gcc, books. info wanted...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 00:38:55 UTC
From: brunos@mafalda.math.mcgill.ca
Message-ID: <CJ4sGw.MqM@sifon.cc.mcgill.ca>
Source record: 35193

Hello, I am going to buy a falcon soon, and so, have a few questions
about it.

First, I am quite confused about what to do about a monitor. I was
thinking of getting a VGA, or SVGA monitor with Sblaster or BlowUp, but this
would not allow me to use software needing a RGB monitor. Also, I was wondering
if anybody has tried to connect a 19 inch sun mono monitor to the falcon, and
whether this is feasable(it seems that the amount of memory bandwidth used for
1280*960 at 72hz in 2 bits would be the same as that used by 640*480*8). But
no company makes a screen enlarger that supports this size(the clocks on Blowup
and co only allow 800*600 at this rate), how hard would it be to make (or
modify) an adaptor to support this rez?

OK, next. I am getting a large SCSI HD(I don't think I can afford one
larger than 300-500 megs) and I was wondering what solutions there are for
memory upgrades. I am probably going to get the 1 meg Falcon, and will need
to upgrade it to either 4 or 14 megs(am I right in assuming that there are no 8
meg upgrades available yet?). To do this, I will need a sim board, I would like
to know what type of simms these use, and what modifications need to be made to
the falcon.

OK, now onto the software. I am getting the falcon, mainly in order to
do DSP programing(and also general programing for my CS courses). What language
setups do you recomend? I was thinking of going with GCC, as a C++ compiler,
along with the PD dsp assembler. Are there the required librairies
available for C++ or will I have to stick with C? Also, as far as an RCS, what
would you recomend? and is the DevPac DSP, a much better assembler than what
can be gotten in the PD? Oh, and what about 68882 support?

As far as music software is concerned, what is available? Has anybody
tried DigiTape 2.0, Cubase Audio, or Notator Logic Audio, or dos anybody have
information about these packages?

For telecomunication software, what is a cheap FAX package for the ST?
(I just want to use it to receive Faxes.. and maybe send ASCII files as Fax.
Also, A slip that could multitask would be nice. Any information?

Onto games... Are there any that are falcon specific? what are they,
how good are they????

Almost finnished I think. I only have questions left about
documentation. What books would you recomend, as resources for programing in
TOS and MultiTos, as well as taking advantage of the Falcon and the DSP. I have
heard of the Atari compendium, is this a good book? I don't care if these
books, or any of the software recomended, are in English, French, or German.

Oh, I almost forgot, does anybody know of any books about programing the DSP, or about algorithems for effecs, synthesis, etc?

Well, I think that about does it for this post, Any help or recomendations would be greatly appreciated.

Bye, Bruno Schmidt
brunos@mafalda.math.mcgill.ca

PS: one more quesion, not really related to he falcon. Are there any discussion groups about the ST/Falcon, available in diges form(or whatever), which are in german of french, or is c.s.a.s the only resource available on the whole internet?

It did on mine, (actually, it was repaired only a week ago) and it affected
HD-boot in the same way you described. Looks like TOS doesn't handle a
faulty WD1772 too well... I hope this isn't the problem with your machine,
because that means trouble: the WD1772 is out of
production. My repairman found one on someone that upgraded to an AJAX-chip
(High Density).

Good luck,

Odin was a high resolution and/or 256 color board, there was a review a long
time ago...in ST Magazin...however it was I think distributed or made...
whichever by Marvin AG, which...unfortunately are out of business...I do
not know who the original developers where for that board.

Cheers

Well, after about a total of 4 month of waiting for an unnamed video card supplier to carry out his promise, I'm again asking for help (not fake help, real help)... Anyways, I have a Mega STe 4 with a Video Card. The Video card is a Matrix C32 video board. I bought it from a auction and have been unable to get the Driver software for it. This unnamed person has wasted my time waiting for software promised (I even simply asked for a phone number, but instead he passed me off to another user, which, is obviously unwilling to help (I understand why ;{) ....

ANYWAYS! IF YOU KNOW OF MATRIX'S phone number OR have the drivers for this CARD, please let me know. I need very much.

If I don't get this going I'll have to fork out money for a better card like CyberCube's Cyrel Sunrise (I'd prefer not to)...

Presumably the digits would not appear in the unshift array on French
TOSes. Hence would it be useful to search *all* 3 arrays?

Your method also fails (slightly) with Alt and the top row of the main
keyboard. These keys return a 'too high' scancode which, if indexed
into Keytbl, return ASCII codes of 0 (IIRC...) which are not very
useful :-(

The arrays are 256 bytes each, the third array is capslock.

I still think we need the actual scancodes as returned by GEM, for
reasons covered in another message.

The only way that will work is by checking the AES version. Versions
3.3 and greater will handle G_CICONS, older ones won't. The AES
version is placed in your AES global array when you do an appl_init. I
think it in AESglobal[2]

DMA sound wasn't supported in Tos 1.6/1.62 found on the STE. I suspect the same
is true of the Tos in MSTEs & TTs.

|> I don't want to have to write to any hardware registers because then I would
|> have to check which particular machine I was on, not just whether _SND was

Why don't you check the _SND cookie. If you have 8bit stereo you assume
your're on a STE/MSTE/TT and hit the hardware. If your have 16bit sound then
your're on a Falcon or better and you can use the XBIOS calls in the Falcon
developers guide.

I am also using 1.08, no MemProt (compiled with Lattice, rather than gcc,
though). I'm a bit happier now that NVDI loads after MiNT, crashes are
much less frequent now.

There are XBIOS calls for DMA sound in Falcon TOS (4.0x). For STE you'll
need to access the hardware registers directly. There's plenty of sample
code lying around to demonstrate this. The registers on the Falcon are
compatible with the STe, so access the h/w directly for portabillty.

IIRC, the new XBIOS calls are documented in the HiSoft book
"Modern Atari System Software", and in the famous Atari Compendium.

From: tmoffitt@bfsec.bt.co.uk
Message-ID: <CJ5LF6.5vw@bfsec.bt.co.uk>
Source record: 35210

Guys,

How can I thank you !!

Last night (after receiving some direct EMAIL after the Christmas holidays
from some of you), I decided it was time to try out a couple of suggestions.

My setup is a 520 STFM with 4Mb RAM, TOS 1.02, 32 Mb HD.

The system was always very slow (for the past 3 years or so.....). Being
relatively new to Usenet, I didn't know about all of the problems with the
different versions of TOS.

Several PD utilities were suggested as 'musts' : FATSPEED, PINHEAD, FOLDERXXX

So last night I tried them. All I can say is 'WOW!!'. The system is REALLY
fast now, both at booting and loading up programs. Boy, have I been living
in the dark.

I've got 'QuickST', but maybe I should get NVDI now.....

Thanks again.

86. AES weirdness

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 11:29:52 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2ge8bgINNjgr@bambam.cs.city.ac.uk>
Source record: 35208

I've noticed the following weirdness with (ROM version of) AES on my Falcon:

(1) Rectangles returned as part of a rectangle list for a window may
not (necessarily) lie with in the screen boundries if the window
is only partly on the screen.

(2) AES will do a (suboptimal) full redraw (rather than a raster copy
& partial redraw) of a window under the following circumstances:
(a) a window partly off screen is moved.
(b) a window is upsized.
(c) a window is downsized & moved in one operation (inverse fuller).

(3) The pixel in the left bottom corner of a windows shadow is not
actually part of the shadow but part of the background. However
when AES moves the window it takes this pixel with it.

(4) If your application is only looking for single clicks (with
evnt_multi()) you get two copies of each WM_ARROWED message!
If you then open a DA that accepts double clicks the problem
goes away until you close the DA.

Are these features/bugs well known? Are they documented anywhere? Did they
exist with pre-Falcon AES versions?

Clearly (1) can be fixed by intersecting each rectangle with the desktop
WORKXYWH. Are the fixes for the others?

Steven

87. Safe scrolling

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 11:56:54 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2ge9u6INNjgr@bambam.cs.city.ac.uk>
Source record: 35211

I have a window whose contents are
(1) To large to store as a bit map
(2) Expensive to redraw
and I'm trying to implement efficient scrolling over this contents.
Doing a full redraw each time is hiddeously expensive. Since (for
a normal window, not a untoppable one) a window can only be scrolled once
it has become the top window, I started off with a simple vro_cpyfm &
partial redraw for the windows WORKXYWH rectangle without worrying about
the rectangle list.

This is just about usable but then it occured to me that (especially under
MultiTos) arbitrary amounts of time could pass between
(1) AES generating a scroll message
(2) My app getting the scroll message
(3) My app locking the screen to start the scroll
and by this time the window may no longer be on top, so I might corrupt
some other apps window.

To fix this I changed the code so it walked the rect list and did a
vro_cpyfm & partial redraw for each rectangle. Since there is usually only
one rectangle there is no noticable slow down.

However there is still a problem: Suppose another app makes a dirty
rectangle over my window between (1) & (3). Then I will end up
vro_cpyfm'ing "dirty" pixels and when I eventually get a redraw message
to clean up the dirty rectangle, the dirty pixels will be elsewhere on
the screen.

Is there a way around this?
Is it important to fix this for programs that may run under MultiTos, or
is the above scenario to unlikely to worry about?

Steven

No, they are only 128 bytes each. The combination alt-top line
returns scan codes greater than 128, which have to be special cased.

I've got the T-64 in my ST, we had some fun hacking the shielding to get it
to fit in there with my Xtra ram board but other than that it went in fine.
I then had some problems with disk writes and sense errors on my hard disk. After
a couple of calls to a very helpful help desk it was traced to a chip loose in
it's socket. No trouble with it since and having the ability to still come up in
1.09 is a plus when the old games get dusted off.

aR> the data?

The third is for CapsLock. With newer TOS'es there also is a fourth table
for Alternate, but this is in a slightly different format.
(TOSes that have the _AKP cookie; 4.0x have this, 3.06 does not).

95. gcc gem binding bug?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 18:12:25 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2gevu9lNNkg8@bambam.cs.city.ac.uk>
Source record: 35222

I think I've found a bug in the gemfast bindings (gem16.olb) that
come with gcc.

With the following code fragment I expect to get a MU_TIMER event every
100mS and with H&S C I do. But with gcc I don't, but MU_BUTTON & MU_MESAG
events are received as normal.

```
:
s = 1;
for(;;){
r = evnt_multi(MU_BUTTON | MU_MESAG | MU_TIMER,
2, s, s,
0, 0, 0, 0, 0,
0, 0, 0, 0, 0,
msg_buf,
100, 0,
&m_x, &m_y, &m_state,
&k_state, &k_ret, &n_clk);
if(r & MU_TIMER)
s ^= 3;
:
}
```

Are the timer LSW and MSW the wrong way around in the bindings?
I'm running gcc v2.3.3 on a Falcon. Has the problem be found & fixed in later
versions?

Incidently what is the most efficient way of reading both mouse buttons
under GEM; (a) for single clicks only, (b) for single & double clicks?

Steven

Since color icons are AES-specific, it should be enough for the
GEM-Version. You can find it somewhere in the GLOBAL-ARRAY after
an appl_init

> I don't want to have to write to any hardware registers because then I would
> have to check which particular machine I was on, not just whether _SND was
> supported. I also want to be compatible with future computers.

AFAIK, STe and the TT does not have built-in system calls for DMA sound control. The only way to get DMA on the machine is to call the register directly. In my 'experiments', programs coded using these registers do work on the Falcon as well, although microwire commands will not work.

It is recommended that the xbios calls are used for the Falcon and a complete listing of the int numbers can be found in the Atari Compendium. If you want your program to work on all three models, you could include a machine detection code and use the appropriate subroutines for DMA sound generation.

Ta Ta For Now,
Michael Fung

I recommend to use NKCC wich was developed by Harald Siegmund, Germany.
This tool converts the scan-code and the key-state, wich were returned
by evnt_multi() to a "normalized key code" wich is really independend
of TOS-version or language ! This means: You will get a _correct_
code for "[Alt]+[3]" or "[Alt]+[=]". NKCC also handles the differences
between different languages (german, english, french and so on).

BTW: NKCC also comes - "ready to use with C" - with the RCS "Interface" by
Shift, Germany. Sources (68000-assembler) are also included !

105. WANTED: INFO ON SIMMS MEMORY UPGRADE HACK FOR STs/MEGA STs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 21:10:40 UTC
From: jhurwitz@access3.digex.net
Message-ID: <2gfacg$sh2@access3.digex.net>
Source record: 35229

Sometime ago, there was a discussion about Memory Upgrades for regular STs
and Mega STs using SIMMS boards. This involved some soldering of a few traces
and clipping a resistor or two.

Does anyone have info on this?.

Has anyone tried it?.

Thanx in advance for any info.

>Is there a system command (NOT HARDWARE REGISTERS) that I can use to play
>DMA sound and I can call (one command) that will work on STE, TT, and Falcon?

I've looked to all the documentation i have - there are only BIOS/XBIOS-
calls to produce sound by using the Yamaha-soundchip ...
I did not found _any_ Bios/XBios/VDI/AES-calls to access the DMA-sound on
STE/MegaSTE/TT in TOS 1.04, 1.06, 2.05, 2.06, 3.01, 3.05 or 3.06 !

>I don't want to have to write to any hardware registers because then I would
>have to check which particular machine I was on, not just whether _SND was
>supported. I also want to be compatible with future computers.

You do not get incompatible with future machines, if you use the cookie-jar
to determine the kind of sound (Yamaha, DMA or DSP) ! You just have to
update your program, if there will be any future machine ... IMHO this is a
"legal" way of software developement on Atari - the cookie-jar is a
documented feature of TOS and should be used for those problems !

BTW: The registers to access the DMA-sound are _identical_ on STE, MegaSTE
and TT !

>I'll need the XBIOS/VDI/AEO command number for whatever it is. I'm coding it
>in machine language so I'll need this number. Thanks.
>
>-Stuart Denman

As i told you - in TOS 1.04, 1.06, 2.05, 2.06, 3.01, 3.05 and 3.06 there
is now Bios/XBios/VDI/AES-command known to access the DMA-sound on
STE/MegaSTE/TT.

108. Can't get Falcon Sound to play!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-05 22:26:13 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Jan5.222613.3849@beaver.cs.washington.edu>
Source record: 35232

I'l doing this is Assembly, but I'll make it easier to understand by using
C coding. Anyway, I've got this 8-bit mono sound in memory
and I just want to play it. The sound data is fine, I checked that.
When I execute Buffoper(1), I get nothing. When I look at the buffer pointer,
it seems to go from BEFORE the start address up to the start address (I print
it at fraction of a second intervals).

Here's the code:

```
Setmode(2) * 8-bit mono
Devconnect(0,8,0,4,0) * From memory to Speaker. What is the last param. for?
Setbuffer(0,begaddr,endaddr) * Start and end of my playback buffer
Buffoper(1) * play once.
```

Shouldn't that work? I don't think I get the Devconnect command too well.
I'm going by some description of these commands that is not very detailed.
I ordered Atari Compendium, but I don't have it yet, so don't say..."Check
Atari Compendium."

Thanks for any help...

-Stuart Denman

The beta offer was always posted as a limited time only, and the full release
version of Geneva has been available for a while now, directly through us,
or through dealers and mail order. I'm sorry I missed this post when it first
came through, but I had no net access for about two and a half weeks around
Christmas.

The newsletters went out over the past couple of weeks to all of our registered
users. It is possible that in some cases people could get them faster overseas
since they had to be sent by first class air mail. The US and Canada ones went
out bulk rate.

The order form on the newsletter does have a line for Geneva by itself, and
there should be a white third of a page flyer with every newsletter which
has a smaller pre-order form for NeoDesk 3->4 upgrades, which includes Geneva
bundle deals.

Try changing to devconnect(0,8,0,4,1) and adding:

settrack(0,0)
soundcmd(4,3)
setmontrack(0)

And don't ask me for an explanation, it works but I'm not 100% sure why.
Hope it works.

============================

It took me awhile to figure out what all the confusion is about.
If you get an ASCII value of zero from evnt_multi because you have the
ALT key down, then you need to look into Keytbl(). Otherwise trust the
ASCII value returned. Keytbl() is the scan-code -> ASCII table used by
the OS and is already country specific. Use the scan-code as an array
index into one of the tables.
```

Jeff Poling (jpoling@magnus.acs.ohio-state.edu) wrote:

: If anybody knows how to use, and where to plug in, the DragonWare STacy
: batteries, please drop me a line. I received no documentation on how to use
: them when I bought my STacy used.

After some testing, I believe that I have found the proper method
of installation for the Stacy battery pack. I do not have the Dragonware
pack (I got my power-sonic pack from Best electronics) but I imagine they
are quite similar.
First let me say that you should not try to cram the batteries
into the compartment if they do not seem t fit. The Stacy (although
plastic) is coated with a metallic paint (for shielding) which IS
CONDUCTIVE! When I first started putting my pack in, I saw sparks! My
battery pack fits, but the terminals on the top are about a half a
centimeter too big. I prevented any further problems but removing the
back panel of the battery compartment (not visible from outside) so that
the terminals weren't pressed up against the wall. Then I insulated the
terminals to avoid any other trouble.
Also, the Stacy battery should be chargable without the Stacy (at
least mine has the same power connector that is on the back of Stacy,
in addition to its direct to Stacy leads. You may wish to give it a
good charge before testing (since you won't know if it works without
power, and the possibility of attempting to charge the batteries
inside the Stacy with uncertain polarity could be disasterous).
Be very careful when disassembling the Stacy - the monitor wires
are probably tied and will make it difficult to get apart (don't force it
too much). Also, when you have all the screws out of the bottom, the
case will still stay intact because it -snaps- together. Gently convince
it to pop open.
Warning! Be VERY careful with the keyboard because if one of the
traces on the mylar ribbon to the keyboard cracks, you're history - it
absolutely cannot be soldered. Metallic ink pens could be used to repir
the trace, but would most likely crack again. When mine cracked (after
fiddling with my Stacy too much) I had to run some thin filaments through
the traces back and forth to regain continuity. Okay, enough of that, on
with the installation...
First, use a meter and be sure that you know which pin of the battery
connector is negative and mark it with something.
If you have the Stacy open, you should see a hole in the
shielding with a row of pins inside. This is on the back left
corner of the board under the left side of the battery compartment.
Within that group of pins is where you connect the battery pack. My
battery is only two pins wide, if yours is as well, now you get to figure
out which pins to use.

Now, on the row of pins, several of them are connected to power, and
several of them are connected to ground. They seem to alternate; but
regardless, the pins that you are interested in are the upper middle ones.

They are as follows... (assuming you're looking at the hole in the shield)

```
---
^ |.|
| |.|_Negative battery lead -
Back |.|_Positive battery lead +
of |.|
Stacy |.|
---
```

I highly suggest that you verify this polarity with a meter (just to
be safe). You should make sure that there is voltage across these two pins
even when the Stacy is plugged into the wall, but the power switch is turned
off (and the battery isn't connected). This will insure that the battery
will be able to charge when the system is turned off, but plugged into
AC. It is possible to run the system from a different set of pins, but
the battery will not charge (and who knows what else).
If you are certain about the polarity of the battery and of the
pins on the board, you can run the leads through the battery compartment,
and connect them to the board. Then carefully close it all up, and you
should be ready to go.
It's really not as complex as this post might make it seem - I
just believe that it is essential to be VERY cautious when it comes to a
Stacy, because, you can't exactly replace it.

E-Mail me if you have
other Questions......

>
>
> Thanks in advance.
> --- Boris

I have the Compo 'T-64' in my 1040STF with a 4MB RAM upgrade. The good
news is you *don't* have to modify the motherboard. The bad news is you
do have to use a soldering iron, and it's a real drama fitting the
thing into the very limited space available. The procedure is to solder
a socket onto the pins of the 68000, then plug the T-64 into the socket.
Much easier said than done. You will have to lift the motherboard out
of its tray to check *all* the joints with a continuity tester.
The board is also very sensitive to whether or not it is correctly
seated in the socket; I had to flatten down the SIL resistor packs
around the 68000 before it would seat properly. (If you did that first,
it would probably make the soldering easier.)
On mine, the 68000 is underneath the internal drive; I had to remove
the drive bottom plate and shim the drive up with washers to stop the
T-64 interfering with the disk fan.

It's not perfectly stable, either, but I don't know whether that's
the T-64, or TOS 2.06. I can also imagine reasons for preferring a
hardware-switched upgrade, if you could find somewhere to put the
switch. (Thinking of which, does anyone know whether you can
hardware switch a T-64?)

Having said that, it works really well. Big improvement on TOS 1.0 :-)
It's software switched, so you must have the switch program in your
AUTO folder (or use the desk ACC) to be able to use it, but that also
means you still have your original TOS available for programs which
are not compatible with 2.06 (DR LOGO?). I'm happy with mine.

On German keyboards, ALT-A..Z is save. Most libraries only use ALT-<c> as shortcut
if and only if it didn't produce an ASCII value.

Hi there.....

Happy New Year to you all :-0

Query....

How do I implement a high dens disk in my Atari STe (TOS1.06/2.06)?

Do I just take out the WD1772 and replace it with an AJAX chip? If so how much are they...where can I get one from, and how easy is it to fit one in?

Or do I have to do something to the WD1772, by adding some extra module onto it?

Any help would be appreciated..

Thanks.
Danny.

To use the 68010 with an original TOS 2.06 you only need to install any
autostart application. Then this bug won't have any effect.

Well, true in a sense. Americain keyboards have one key less. But
would you call a UK keyboard foreign? I wouldn't, and I'm Dutch :-).

Well, those combinations have a code (i.e. the full int k_code) which
is unique for all systems, i.e. the scan code plus a zero for the
lower byte. Obviously, for those codes I don't use this routine
at all.

You check the GEM version number instead of TOS. It can be found
somewhere in the _global array.

All of the problems are known in older TOS-version also. To fix (4)
you may use ARROWFIX.PRG. If you want to get more windows without using
MultiTOS you have to use WINX 2.2 - it includes the ARROWFIX-patch, allows
up to 40 GEM-windows, allows you to handle background-windows and so on...
For (3) there is not bug-fix ... this is known in older TOS-versions also,
but i did never hear of a fix for this problem.

128. SpeedoGDOS: The `fix31' data type.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-06 14:28:06 UTC
From: djs@jet.uk
Message-ID: <1994Jan6.142806.16227@jet.uk>
Source record: 35048

SpeedoGDOS uses a fixed-point data type to represent spacing with
better-than-pixel resolution. Both Atari Compendium and HiSoft's
Modern Atari Software describe this data type the same way, with the
same examples (so, presumably, both copied from official Atari docs).

Yet the name and description given do not tie up with the examples.
If someone describes a data type as a sign bit + 31 bits magnitude,
that would imply to me that +1 and -1 would only differ in the sign
bit, eg 0x80010000 for -1, and 0x00010000 (assuming fixed point between
bits 15 and 16).

The examples given quote
+1.0 = 0x00010000
-1.0 = 0xFFFF0000
+1.5 = 0x00018000

That is NOT one bit sign and 31 bits magnitude, but is 32 bits
2's complement (with a fixed point, of course).

Which is correct? The description or the example? And where's the
bloody PostScript driver (I know I've asked that one before!) ?

129. Using the ST for climat control (in dovecots)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-06 14:40:17 UTC
From: alberts@cs.utwente.nl
Message-ID: <1994Jan6.154017@cs.utwente.nl>
Source record: 35047

Hi,

Did anyone experiment with the use of the ST for measuring and controlling temperature and humidity in a room or something? I am looking for the required hardware/software to use an ST for regulating the temperature and humidity in dovecots. The idea is to use cheap sensors (any diagrammes available?) for measuring temperature and humidity, if necessary convert the signals into digital ones, and feed them into the ST. The ST is used to verify and store these values, and, in a second phase, to send control signals to the heaters and air-conditioning. I could think of a number of possible set-ups, but I'm really looking for suggestions/diagrams/software from someone who's actually built something similar (including all the necessary hardware).

Thanks in advance,

Mert.

From: labrou_j@xenon.epita.fr
Message-ID: <2ghdad$435@boson.epita.fr>
Source record: 35052

I have got a STF with 68010 at 8 Mhz and a TOS 2.6.

It works fine with a patch cause of a ROM bug:
The ROM find a 68010, but execute a `movec cacr' when a NEWDESK.INF
is loaded by the DESKTOP (???). But the memory cache exist only
since the 68020.
My patch modify the illegal exception, and `RERUN' after the `movec'.

A 10 Mhz 68010 is a bad solution, because of SHIFTER conflicts.

Problems: the Pure Debugger don't accept the 68010...

MiNT works very well...

For fun, with the 68010, I have emulated DMA sound !!!

Performances: I win 15% only for div/mul ;-) , now I work on virtual
memory not possible on a 68000.....

With a 68020/30/..., there are less compatibilities problems...

- Jean - The only 68010 ST user ?

|> AK> slow down the processor.
|>
|> Since when does a cache slow down a processor??
|>

That is a question of memory access. If you can access the
memory in synchronous mode with 8 MHz it is faster than
asynchronous mode at 10 MHz, even if you use a cache.

C't tested some configuration for there PAK/3 and if i remember right
there is no difference between an 16 MHz without cache and an 20 MHz
with cache since the 16 MHz timing is in sync with the bus but the
20 MHz isn't.

In this case a 20 Mhz CPU is slower than it could be.

It's half a year ago since i read the article, maybe the facts are
a little confused in my memory (still without cache:-). I will look
it up and post more infos about the PAK/3 next week.

There are several viri out there that "slow things down" as part of their
payload. You might want to suck up a copy of vkiller from atari.archive
and check your boot disks (I presume you have a disk in your floppy when
you boot, to speed things up).

---begin included text---

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040)
The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather
strange connector on the end. To prevent having to cut the mouse cable up,
I made this adaptor. If you still can't follow it, please let me know and
I'll try to redescribe it. This does work for me. I've been using it for
6 or so months now with no problems at all. It does take some soldering
skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I
have not asked Atari. :-)

Atari ST Microsoft Mouse ST expected signal
----- -- --------- ----- -- -------- ------
1 5 XB
2 3 XA
3 8 YA
4 9 YB
5 N/C N/C
6 2 Left button
7 N/C +5VDC (N/C)
8* 6 and also tie to pin 1 Ground
9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

Jeff

Too bad I don't have my C't's around here.
A cache doesn't only speed things up in the general case, it also
helps decouple two buses (act as a buffer) (f.ex between the CPU bus
and the memory bus).

In clear, either your persistent memory is somewhat volatile, or the
problem is a very subtle (or stupid) one. Especially when you know
that a cache can almost double the speed of a 68K-16.
Or maybe C't just blew it !

141. AT-Speed upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-06 23:23:57 UTC
From: meyer@u.washington.edu
Message-ID: <2gi6id$e3u@news.u.washington.edu>
Source record: 35065

I have a Compo 286 (AT-Speed C16) operating in my 520ST. It works well. I read in the fall issue of Tigar Software Catalog, an add for a small 486 upgrade board built specificly as an upgrade path for 286 machines. It's call by them a "Make-It 486". The add says all one must do is pull the 286 out and plug in this small board into the vacant space. The picture in the catalog shows the board populated with a Cyrix, Cx486SLC/e-33-MP and 2 other small chips (labels I can't read).

I presume this works in real PC's. Although, I don't understand how a 32 bit chip will operate in a 16 bit machine. Maybe someone could enlighten me.

My real question though ,should really best be answered by the Compo people. If anyone knows what their E-mail address would be (if they have one) I would appreciate being informed.

The question is does this small board work as a replacement to the 286 in the AT-Speed? If the answer is yes to this. Are there any additional software issues that must be dealt with not already on the disk furnished with the AT-Speed?

In case someone is concerned with me corrupting the Atari world with PC functionality, I'm sorry. My work machine is a PC. This has given me a degree of flexibility at moderate cost and one machine on my desk. WordPerfect 5.1, Lotus and other DOS based software work very reliably.

>and one of these file when expanded with UNLZH 1.72 yields
>*Bad CRC * messages, and garbage.

I'm just guessing but from what you say it sounds similar to the problem with UNLZH (1.something) I had . It returned a Bad CRC error at the end of dearcing the file. This was because because the archived files were archived using -lh5- method. To see what archive method was used for a file use the V command. To UNLZH these files I used LZH201L.TTP which understands -lh5- method. I hope this helps you.

There is a program in the public domain called something along the lines of
'STARTGEM'. You can use this to auto exec gem programs. It read the program
to be started from a .inf file so you can configure it to load ant program
you like. Details on how to use it should be included with the program.

Nobody seems to mention the most user-friendly method:
Use whatever keys you want, BUT LET THE USER REDEFINE THE SHORCUTS.
The falcon desktop does this, so do some other programs (Connect?).
It is best if the user simpy presses the key he want's to use for the shortcut - that way you simply record what he pressed - and it will be correct on his machine. In the unlikely event that he switches to a machine with a different language keyboard, he can simply redefine again.

PLEASE do this folks. If it takes an effort to develop a PD routine to do this, I will try to help.

I always get this. It works better if you do the setup and then quit. Everytime I do the install, it crashes so I never bother. Most games seem to run OK when it's done this way.

I've been following this thread on and off, so forgive me
if I missed something...

But it seems to me that using the alt and/or ctl key to produce
accented characters is not quite as elegant as the approach that
was taken in Calamus SL. I enjoy typing in Calamus precisely because
I do _not_ have to go through a bunch of awkward key combinations
to obtain the accented characters that I need.

Here are a couple of examples:

to get an "e accent aigu", type " 'e "
to get an "n tilde", type " ~n "

If I want to type a single-quote, a tilde, or any of the special
characters used to "flag" the use of an accent, all I have to do is
press the key twice. I.e. to get " ~ " , I would type ~~. This is
just a small trade-off, in my opinion, for the convenience of
being able to type accented characters without the need for alt/ctl
key combinations. It has the added advantages of not breaking my
rythm at the keyboard, and of not making assumptions on the nationality
of the keyboard.

I like this approach so much that I would be the first in line
if someone wrote a TSR that replaced the standard TOS mappings with
the ones used in Calamus SL.

The example is correct. At least, the advances mechanism works like
the example, which is essentially the same.

I shook my Speedo box, but there wasn't one. The box blurb did say it
supported all popular printers, so I guess Atari know that Postscript
isn't popular.

And if you need some vdicall that is not supported by Gemfast, you can use the vdicall() function for which you have to supply your own parameter arrays (the gemfast documentation will explain the call and generic GEM documentation will tell you what to put in the arrays)
Mind that because GEMfast uses a *smart* routine for vdicalls you can only call vdi functions from 0 to 255 (it pushes the vdi number in the high byte of a longword register) so that means some of the newer speedo functions cannot be accessed in this way.

Erlend.

Perfectly reasonably, and it isn't a problem -- you need to do an intersection with the rectangle and the window anyway to work out what needs to be redrawn.

>(4) If your application is only looking for single clicks (with
> evnt_multi()) you get two copies of each WM_ARROWED message!

This is a well-known AES bug. I vaguely remember the fix being something like waiting once for a double-click. Then the problem goes away.

One of the strong points (excuse the pun) of fixed-point is that you can
manipulate the numbers with standard integer operations. This gives
fixed-point its widely touted speed advantage (though most forget that it
also offers constant error, but I digress).

I would therefore guess that the example is correct, and that the
description is wrong. Besides, you get all sorts of ambiguity (e.g. what does
0x8000000 represent ?) if you use sign bits and magnitude. Fixed-point is
quite rare -- it wouldn't be the first time it's been misunderstood.

Well, that's EXACTLY opposite to the international convention, which is
control + key for menus, Alt + key for dialogs. Alt + key is often
used for menus as well, but the tendency for the last, say, year, is
to use Shift + Control instead.

John Perez did willfully write on 06 Jan 94 (to Jeff Poling), and I quote...
JP> [...much info on batterypack...]
JP> Be very careful when disassembling the Stacy - the monitor wires
JP> are probably tied and will make it difficult to get apart (don't force
JP> it too much).

Wires to the screen may in fact be held in place on the internal metal shielding by a bundle clip (forget the proper name for those). You'll have to cut one of those. To get more slack to reach this, remove back cover of screen (2 screws hidden under the Atari-Stacy logo strip below screen front) which is otherwise snap-click fit, and back screen bracket, which will allow you to feed some centimeters of wire through the hinge hole.

JP> Also, when you have all the screws out of the bottom,
JP> the case will still stay intact because it -snaps- together. Gently
JP> convince it to pop open.

And note how it is also held together by the molding of the floppy drive's front panel and button. (A very intricate puzzle this...)

JP> Warning! Be VERY careful with the keyboard because if one of the
JP> traces on the mylar ribbon to the keyboard cracks, you're history -
JP> it absolutely cannot be soldered. Metallic ink pens could be used to
JP> repir the trace, but would most likely crack again. When mine cracked
JP> (after fiddling with my Stacy too much) I had to run some thin
JP> filaments through the traces back and forth to regain continuity.

Hm, this is a common problem with foil traces. Same happened to mine after some service -- found a random selection of keys had "died". A workable kludge fix to this is to wedge a small stiff bit of plastic or cardboard into the case bottom under the loop of the mylar ribbon when correctly assembled again, holding the loop up and apparently closing the cracks.

JP> [...more battery stuff munched...]
JP> It's really not as complex as this post might make it seem - I
JP> just believe that it is essential to be VERY cautious when it comes to
JP> a Stacy, because, you can't exactly replace it.

Hear, hear. And funnily enough, Stacy users don't seem particularily keen to replace them either :) BTW, nice guide to battery installation.

There are at least two small auto folder programs that can do this for you.
One is Startgem, the other is Headstart. Both should be available from
atari.archive.umich.edu. I have been using startgem to start Neodesk for
years, without problems.

162. TOS 2.06 & AJAX

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-07 20:07:48 UTC
From: trumpet-user@csi.uottawa.edu
Message-ID: <trumpet-user.8.757973268@csi.uottawa.edu>
Source record: 35089

Hi! I have a TEC board that I will install in my 1040ST. I understand that this will upgrade TOS 1.0 to 2.06, but I will also have to upgrade my floppy disk controller. I've been told that I must seek out the "Atari Ajax Chip". Does anyone know where I should begin my search?
Does anyone know Atari's internet address?

Also I have been using a Zubair ST/ime clock 'add on' with my old roms (I believe it is under U2, on a 6 chip 1985 1040STf.
Does anyone know if there is any way that I can salvage the clock for use under TOS 2.06? I talked to Codehead Tech. and they were not sure what would happen and that I was on my own(breaking new ground).

Thanks
Chris

163. Re: Can't get Falcon Sound to play!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-07 20:57:58 UTC
From: sdenman@lynx.cs.washington.edu
Message-ID: <1994Jan7.205758.21356@beaver.cs.washington.edu>
Source record: 35090

I found out why the sound didn't work...

I had SAM installed, and everytime I pressed a key to play the sound, SAM's sound would override mine and therefore mine would not play. The pointer was messed up because it was following SAM's sound. Pretty crazy.

164. Idea: 68010/10 in Atari ST

>autostart application. Then this bug won't have any effect.

Is there anything to gain by replacing my 16 Mhz 68000 with
a 16 Mhz 68010 in my MEGA STE ?

How about problems (except for that one with the crash) ?

Is it possible to gain even more power, is there such a thing as
a 68000 og 68010 with internal clock-double (as the PC DX2 series) ?
A 16 Mhz 68000 with 32 Mhz internal structure would have been OK :-)

165. STe overscan??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-07 21:39:32 UTC
From: dwb29497@uxa.cso.uiuc.edu
Message-ID: <2gkkqk$kqi@vixen.cso.uiuc.edu>
Source record: 34991

Does anyone know how to do an overscan modification to an STe? I've seen some articles on how to do it to an ST, but the software is specific to the ST (TOS <1.4), and I think the chips involved are different on the STe. I only need monochrome overscan, if than makes any difference.
Thanks in advance for any help.

I could be wrong, but I think the GNU C version of the GEMlib wisely
uses a long there instead of two backwards shorts (which was an evil bow
to the little-endian 16-bit 8088 origins of GEM)...

I would suggest you try a newer version of LZH.TTP. I have experienced that problem in the past also...and the newer version doesn't like files compressed with Version 1.72 either...I keep several .ttp's handy. And use Quester with them.....of course V1.72 is basically a stand alone thing so I use it that way. Don't know how many times I cursed my modem before I figured this one out...or how many downloads I deleted unnecessarily.

Good Luck....Earl

169. Re: SpeedoGDOS: The `fix31' data type.

Newsgroup: comp.sys.atari.st.tech

From: ekl@sdf.lonestar.org
Message-ID: <CJAsLE.51G@sdf.lonestar.org>
Source record: 35003

```
==================================
The examples given quote
+1.0 = 0x00010000
-1.0 = 0xFFFF0000
+1.5 = 0x00018000

That is NOT one bit sign and 31 bits magnitude, but is 32 bits
2's complement (with a fixed point, of course).
==================================

Considering that a normal "signed int" <32 bit unsigned> is a 2s complement
number then I expect it to be the example. Its kinda correct to say
it has 1 sign bit - because it does, its just that the magnitude things
is a bit shakey on the description. Put it down to a semantic error in
the description. You really can't do math if it was a 1 bit sign + magnitude
type of number. You wind up with two zeros and the difference between 1
and -1 would be 3 and all sorts of nasty stuff. I'm putting my money on 2s
comp being correct.

NNTP-Posting-Host: carson.u.washington.edu

I have a Compo 286 (AT-Speed C16) operating in my 520ST. It works
well. I read in the fall issue of Tigar Software Catalog, an add for a
small 486 upgrade board built specificly as an upgrade path for 286
machines. It's call by them a "Make-It 486". The add says all one must
do is pull the 286 out and plug in this small board into the vacant space.
The picture in the catalog shows the board populated with a Cyrix,
Cx486SLC/e-33-MP and 2 other small chips (labels I can't read).

I presume this works in real PC's. Although, I don't understand
how a 32 bit chip will operate in a 16 bit machine. Maybe someone could
enlighten me.

My real question though ,should really best be answered by the Compo
people. If anyone knows what their E-mail address would be (if they have
one) I would appreciate being informed.

The question is does this small board work as a replacement to the
286 in the AT-Speed? If the answer is yes to this. Are there any
additional software issues that must be dealt with not already on the disk
furnished with the AT-Speed?

In case someone is concerned with me corrupting the Atari world with
PC functionality, I'm sorry. My work machine is a PC. This has given me
a degree of flexibility at moderate cost and one machine on my desk.
WordPerfect 5.1, Lotus and other DOS based software work very reliably.

>How do other GEM programmers attack the differences between various
>international keyboards?

My approach is to use <Control>-<key> in windows and dialog boxes, and
<Alternate>-<key> for the menu bar.
Then, I only use internationally available letters A to Z.

> Is it true that a combination Control - ] (closing square bracket)
>does not make sense on a German keyboard?

It does. The ] key has A umlaut in lower and upper case, ] and }.

GhostScript needs the Diablo Emulator for printing on SLMs. Remember that
you need Diablo version 1.6 for use in MultiTOS. Older versions won't
work.

I'm just guessing but from what you say it sounds similar to the problem with
UNLZH (1.something) I had . It returned a Bad CRC error at the end of
dearcing the file. This was because because the archived files were archived
using -lh5- method. To see what archive method was used for a file use the V
command. To UNLZH these files I used LZH201L.TTP which understands -lh5-
method. I hope this helps you.

Even if a clock doubled 68K existed, what would be its point ?
Look at the timing of its instructions: most of them are memory
bandwidth limited (that is, their time is approximately the sum of all
the memory accesses necessary). Unless you add a cache between the CPU
and the bus (= an on-chip cache), you'd get about 5% (wild guess)
speed improvement (my wild guess would be almost the same for a infinitely
fast internal clock). Adding an on-chip cache means reengineering,
incompatibilities, ...: it's just not a 68K any more. Given today
technology, Motorola preffered push the thing a little bit more so as
to go even faster. It's called 030 or 040 or whatever.

Note that the 030 is not that expensive any more (I had an address (a
year ago) where they had 16Mhz parts for $50)

I know very well who vi is intended for.

My point in bringing up vi was that if you only aim to please
programmers when developing an application or an interface, you will
end up with something only programmers will want to use. That's
fine for vi, but it is not a desirable result for a general
purpose application such as a keyboard interface.

And if you need some vdicall that is not supported by Gemfast, you can use the
vdicall() function for which you have to supply your own parameter arrays (the
gemfast documentation will explain the call and generic GEM documentation will
tell you what to put in the arrays)
Mind that because GEMfast uses a *smart* routine for vdicalls you can only call
vdi functions from 0 to 255 (it pushes the vdi number in the high byte of a
longword register) so that means some of the newer speedo functions cannot be
accessed in this way.

There is a program in the public domain called something along the lines of
'STARTGEM'. You can use this to auto exec gem programs. It read the program
to be started from a .inf file so you can configure it to load ant program
you like. Details on how to use it should be included with the program.

Nobody seems to mention the most user-friendly method:
Use whatever keys you want, BUT LET THE USER REDEFINE THE SHORCUTS.
The falcon desktop does this, so do some other programs (Connect?).
It is best if the user simpy presses the key he want's to use for the shortcut
- that way you simply record what he pressed - and it will be correct on his
machine. In the unlikely event that he switches to a machine with a different
language keyboard, he can simply redefine again.

PLEASE do this folks. If it takes an effort to develop a PD routine to do this,
I will try to help.

I always get this. It works better if you do the setup and then quit. Everytime
I
do the install, it crashes so I never bother. Most games seem to run OK when
it's
done this way.

I've been following this thread on and off, so forgive me
if I missed something...

But it seems to me that using the alt and/or ctl key to produce
accented characters is not quite as elegant as the approach that
was taken in Calamus SL. I enjoy typing in Calamus precisely because
I do _not_ have to go through a bunch of awkward key combinations
to obtain the accented characters that I need.

Here are a couple of examples:

to get an "e accent aigu", type " 'e "
to get an "n tilde", type " ~n "

If I want to type a single-quote, a tilde, or any of the special
characters used to "flag" the use of an accent, all I have to do is
press the key twice. I.e. to get " ~ " , I would type ~~. This is
just a small trade-off, in my opinion, for the convenience of
being able to type accented characters without the need for alt/ctl
key combinations. It has the added advantages of not breaking my
rythm at the keyboard, and of not making assumptions on the nationality
of the keyboard.

I like this approach so much that I would be the first in line
if someone wrote a TSR that replaced the standard TOS mappings with
the ones used in Calamus SL.

The example is correct. At least, the advances mechanism works like
the example, which is essentially the same.

I shook my Speedo box, but there wasn't one. The box blurb did say it
supported all popular printers, so I guess Atari know that Postscript
isn't popular.

192. Z-time help

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-08 20:11:10 UTC
From: asmodeus@telerama.lm.com
Message-ID: <2gn40u$8ol@telerama.lm.com>
Source record: 35005

I recently bought a used 1040 for a friend, and it came with the z-time in it. The strange thing for me is that it has TOS 1.0 in it, the 2 chip version, yet there is 6 sockets in the machine. The mother board is revision C, if that helps anyone.

I have two problems/questions:

1) I have an old set of TOS 1.2 from upgrading another 1040, 6 chip set. Can I put these easily in the above machine?

2) The machine has the z-time socket clock in it, but I was given no disk with the computer, and have no idea how to access the clock, nor a way to tell if it is good or not. The computer boots fine with it under the tos 1.0 chips(2 chip set), and I assume that I need to find a copy of the z-time disk. Anyone have the e-mail address for Zubair?

I wish that I could afford the upgrade to tos 1.4 or even 2.06, but not at this time, as it is for my friend, and she will pick that up when she wants it or can afford it. :) (strapped from xmas still)

thanks in advance

- asmo -

Well, that's EXACTLY opposite to the international convention, which is
control + key for menus, Alt + key for dialogs. Alt + key is often
used for menus as well, but the tendency for the last, say, year, is
to use Shift + Control instead.

That's fine for word processing, but a C programmer WOULD mind having to
press " or ' twice.

Perfectly reasonably, and it isn't a problem -- you need to do an intersection
with the rectangle and the window anyway to work out what needs to be redrawn.

>(4) If your application is only looking for single clicks (with
> evnt_multi()) you get two copies of each WM_ARROWED message!

This is a well-known AES bug. I vaguely remember the fix being something
like waiting once for a double-click. Then the problem goes away.

One of the strong points (excuse the pun) of fixed-point is that you can
manipulate the numbers with standard integer operations. This gives
fixed-point its widely touted speed advantage (though most forget that it
also offers constant error, but I digress).

I would therefore guess that the example is correct, and that the
description is wrong. Besides, you get all sorts of ambiguity (e.g. what does
0x8000000 represent ?) if you use sign bits and magnitude. Fixed-point is
quite rare -- it wouldn't be the first time it's been misunderstood.

There are at least two small auto folder programs that can do this for you.
One is Startgem, the other is Headstart. Both should be available from
atari.archive.umich.edu. I have been using startgem to start Neodesk for
years, without problems.

Hi! I have a TEC board that I will install in my 1040ST. I understand that
this will upgrade TOS 1.0 to 2.06, but I will also have to upgrade my floppy
disk controller. I've been told that I must seek out the "Atari Ajax Chip".
Does anyone know where I should begin my search?
Does anyone know Atari's internet address?

Also I have been using a Zubair ST/ime clock 'add on' with my old roms (I
believe it is under U2, on a 6 chip 1985 1040STf.
Does anyone know if there is any way that I can salvage the clock for use
under TOS 2.06? I talked to Codehead Tech. and they were not sure what would
happen and that I was on my own(breaking new ground).

Thanks
Chris

Does anyone know how to do an overscan modification to an STe? I've seen some
articles on how to do it to an ST, but the software is specific to the ST (TOS
<1.4), and I think the chips involved are different on the STe. I only need
monochrome overscan, if than makes any difference.
Thanks in advance for any help.

Who should you have in mind when you develop applications? General
users, or C programmers?

Hint: vi was obviously developped by and for C programmers, and look
how popular it is outside programming circles.

Is there anything to gain by replacing my 16 Mhz 68000 with
a 16 Mhz 68010 in my MEGA STE ?

How about problems (except for that one with the crash) ?

Is it possible to gain even more power, is there such a thing as
a 68000 og 68010 with internal clock-double (as the PC DX2 series) ?
A 16 Mhz 68000 with 32 Mhz internal structure would have been OK :-)

Are you sure you're using the _cell_ height (i.e., attrib[9])? It sounds
like you're using the _character_ height (attrib[7]). I've never had any
problem with descenders, when using the cell height, regardless of what
alignment is specified.

I would suggest you try a newer version of LZH.TTP. I have experienced
that problem in the past also...and the newer version doesn't like files
compressed with Version 1.72 either...I keep several .ttp's handy. And use
Quester with them.....of course V1.72 is basically a stand alone thing so
I use it that way. Don't know how many times I cursed my modem before I
figured this one out...or how many downloads I deleted unnecessarily.

Good Luck....Earl

207. Memory Protection Woes - Help...?!?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-09 07:07:44 UTC
From: mforget@elfhaven.pucnet.com
Message-ID: <H.ekK.w&&34M0NfZI@elfhaven.pucnet.com>
Source record: 35138
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I have a problem that I hope someone can help me with.

MasterBrowse currently has a client-program that works with MultiTOS.
It does not work with Geneva, and probably will not work with Mag!X,
since neither of them support pipes. I would like to modify the
client program so that it relies entirely on passing GEM AES
messages. To do this, I have to be able to pass the filename from
the client-program to MasterBrowse, which requires passing the
address of a string. I know (roughly) how to do this, but I need
to know how I can make the chunk of memory holding the filename
global-readable (so that the client-program will still work with
memory protected systems). I believe that there is a system-level
GemDos call that will do this, but I do not remember the name of
it or the calling convention.

If someone could send me an electronic mail message telling me the
name of the call and how to use it, I would really appreciate it.

Yes. I've confirmed this both on my ST and my Falcon. For some reason, I keep getting a value of 13 for the cell height, no matter what resolution I'm using. In any case, I'm not using vqt_attributes() anymore. Thanks to all who've replied to me in E-mail. All of their solutions worked correctly.

Another problem I've run into is the "double click" problem on my Falcon. The page up/down and arrow up/down messages occur twice on my Falcon even though I do a single click within the slider bars. I don't know how to correct this in software so that it works both on my ST and my Falcon. Changing the double click speed from the Xcontrol panel to a higher setting seems to alleviate the problem, though.

Lars-Erik Osterud (lars-erik.osterud@byte.bbs.no) wrote:
: >To use the 68010 with an original TOS 2.06 you only need to install an
: >autostart application. Then this bug won't have any effect.

: Is there anything to gain by replacing my 16 Mhz 68000 with
: a 16 Mhz 68010 in my MEGA STE ?

I didn't realize the Mega STE had a 16Mhz 68000, as I thought
it had the 68030. Anyway, providing the 68000 being replaced
is the same speed as the 68010, it should work.

Under AmigaDOS, you can get a 5%-10% improvement in speed.
Providing you can get the part cheaply, it might be worth
it. You will probably have to get a patch for the bug in
ROM (if there is any).

: How about problems (except for that one with the crash) ?

Provided the program works with 68020+ processors (ie TT
friendly), it should work.

: Is it possible to gain even more power, is there such a thing as
: a 68000 og 68010 with internal clock-double (as the PC DX2 series) ?
: A 16 Mhz 68000 with 32 Mhz internal structure would have been OK :-)

No such thing to the best of my knowledge.

- Jim

A.V. Groenink did willfully write on 07 Jan 94 (to All), and I quote...
AG> [...]
>> My approach is to use <Control>-<key> in windows and dialog boxes,
>> and <Alternate>-<key> for the menu bar.
>> Then, I only use internationally available letters A to Z.
AG>
AG> Well, that's EXACTLY opposite to the international convention, which

Hm, which "international convention"?

AG> is control + key for menus, Alt + key for dialogs. Alt + key is
AG> often used for menus as well, but the tendency for the last, say, year,
AG> is to use Shift + Control instead.

The developing tendency _seems_ to be Alt- for system/shell, Ctrl- for application. Thus using Alt- within a multitasking application should reliably access the taskmanager or other system functions (or comparable things external to any given application), while Ctrl- keys are specific for functions within an application.

BTW, I seem to remember a by now very old Atari guideline on GEM programming which strongly recommended _not_ to use Alt- shortcuts within applications, though at the time there seemed to be little reason for this restriction.

The grey area here might be menu shortcuts, e.g. Geneva (quite sensibly I think) lets Alt-space open the first menu dropdown of the currently topped menu (application), from which point the menu handler accepts other menu shortcuts, but then the system is restricted to menu processing anyways.

216. Jaguar->Atari Joystick

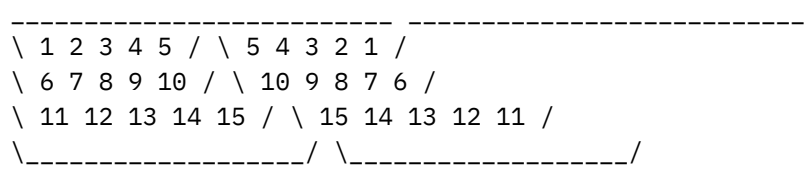
Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-10 05:03:58 UTC
From: jperez@Hawaii.Edu
Message-ID: <CJEE2n.B0s@news.Hawaii.Edu>
Source record: 35016

Greeting Jaguar Fans,

I'm trying to find a way to attach a conventional Atari joystick (hopefully one with auto-fire!) to the Atari Jaguar. You may have noticed that the Jaguar has a 15 pin high density plug; whereas, the old-style Atari joystick has a 9 pin connector. Well, I've taken the time to attempt mapping the pin-outs of the Jaguar, and connected an Atari joystick with limited success. I say limited, because I only have right and left working, with up and down triggering all sorts of things (from keypad keys to system resets).

Here are the pinouts for the Jaguar that I have come up with:

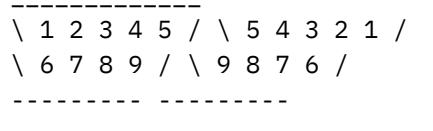
Male Female



1. Keypad 3,6,9,#,Option 6. Pause 11. D-Pad Right
2. Keypad 2,5,8,0 7. +Voltage 12. D-Pad Left
3. B, Keypad 1,4,7,* 8. Not Connected 13. D-Pad Down
4. A 9. Ground 14. D-Pad Up
5. Not Connected 10. B (A&C?) 15. Not Connected

The conventional Atari Joystick pinouts are:

Male Female



1. Joystick Up 5. Reserved/Joystick Up
2. Joystick Down 6. Fire Button
3. Joystick Left 7. +5 volts
4. Joystick Right 8. Ground
9. Not Connected/Joystick fire

I'm not sure as to the accuracy of these sets of pinouts so I would appreciate confirmation from anyone who may have access to such information.
If there is anybody out there that knows how to build an autofire circuit or properly connect an Atari joystick to the Jaguar please let me know in E-mail. Please post any potentially helpful information. Thanks...

yes and no. I cannot get *ANY* of the backwards programs to work and stay
resident during a reboot, most of the time, my machine either reboots
twice (cold boot the second time, which makes it TOTALLY useless), or I get
two bombs. the latest version (which actually recognizes TOS 4.04, go
figure) is completely useless for me both for reboots and for making it
"resident" however, it is possible to install one of the earlier versions
(not sure which one at the moment, I can check it if anyone really needs me
to), and make it "resident" in the system (without the reboot). Unfortunately
this only works for things that can be run from the desktop. Most of the
time I wind up using "magi" for my booting disks, but I am not sure quite
how well it works.

That's true - if you have the TOS 2.06 Eproms too.Most board will only
ship
without the EPROMs.
>disk controller. I've been told that I must seek out the "Atari Ajax
>Chip".
No exactly true.An Ajax is only useful if you plan to include a
ED-floppy
into your compy.A WD1772-02-02 (remember the full name,the WD1772-02 is
that
you have already in your ST!) will do it too.To make a HD-floppy work
on
your computer as a HD-floppy (and not only as an expensive DD) you need
16Mhz bus clock speed - that's that a WD1772-02-02 will create.An Ajax
will
create 32Mhz - that's good if you need an ED-floppy (a HD and/or DD
works
with it,too - of course).You should encounter no problems if you only
implement a WD1772-02-02 instead of the Ajax.I have an Ajax by
myself,but
that's another story...
>Does anyone know where I should begin my search?
No,sorry.

<No Subject>
TITLE: Simulating BSD sockets with MiNT pipes?

Is it possible to simulate BSD style sockets with MiNT pipes? I want to have a server that opens a known pipe, which other clients then connect to. They then tell the server the name of it's unique pipe name, which the server and client talk along.

The problem appears to be one of the server & client knowing when the connection is established with the known pipe, so that they can talk to each other. The idea I had was that the server opens it's end. Then a client comes along and opens the other end and applies a lock. The server checks for this lock, if there is one it starts to talk. Finally when all data is transfered the server sends a close sequence, and when the client has read that it unlocks the pipe and destroys it's end.

Is this feasable or is there a better way. The processes have no way of knowing each others PID etc.

Thanks,

CW

Does anybody know where I can get a service manual for the ST series
of machines, or if there ever was such a manual prouced?

I know that there is a package available from Atari, but I understand that
this is just information on the individual components.

While this is also useful, most of them (except the custom devices) are
freely available from their manufacturers, so what I really want is
schematic diagrams.

Under recent versions of the AES, it is also possible to scroll
background windows (ie not the top window). WM_ARROWED messages are
sent in the same way.

>However there is still a problem: Suppose another app makes a dirty
>rectangle over my window between (1) & (3). Then I will end up

>
>Is there a way around this?

Yes. It is quite simple - just bracket your redraw code with
wind_update(BEG_UPDATE) and wind_update(END_UPDATE). This should
effectively 'freeze' the rectangle list.

**** FLASH II and AUTO STARTING ZMODEM ****

Well we have implemented a later Zmodem here on the VAX,
its the Free Complementry VMS one..

There has been a lot of problems with People using it, I have found that it
needs a Real Auto Starting Zmodem, some of the PC Terminal programs are ok.!
but what I have found that FLASH II 2.2 does not work at all, its not a real
Auto Starting Zmodem..

The funny thing is that THE STORM does work..????

I thought that some of the Beta tester should know this...

Any more info or help Please E-Mail me....

237. Protar Disk Drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-11 13:00:04 UTC
From: jvt@its.bt.co.uk
Message-ID: <CJGus5.3xz@its.bt.co.uk>
Source record: 35117

I have a friend who as a Protar 40 Hard Disk unit on his ST. He wants to add another drive in the box. When I had a quick look, I noted the SCSI ID is set on the interface card and not on the disk drive.

To save me poking about to see what this card does, can anyone tell me if and how a second drive can be added. The how means "what scsi id is it set to".

I suppose a followup could be whether the adaptor can be used to access the full 8 device addressing range of scsi.

Thanks,
John

> Does anyone know where I could find documentation or source listings on how
> to do bitmapping on the ST in C? Thanks in advance...

What, exactly, do you mean? Here is standard C bitmapping for keeping
track of some options (for example... you can use this for anything):

```
short flags = 0;

#define OPTION_1 0x0001 /* 2^0 */
#define OPTION_2 0x0002 /* 2^1 */
#define OPTION_3 0x0004 /* 2^2 */
#define OPTION_4 0x0008 /* 2^3 */
#define OPTION_5 0x0010 /* 2^4 */
/* etc */

flags = OPTION_1 | OPTION_2; /* Turn on options 1 and 2 */

if( flags & OPTION_3 ) /* Check to see if option 3 is set */
puts( "Option 3!" ); /* do something */

flags ^= OPTION_4; /* XOR option 4 into or out-of the flags */
```

If you meant "how do you access pixels on screen by directly
manipulating screen memory", that's a whole different ball of wax... the
ST has strange interleaved screen memory that makes this operation
tricky.

An easy solution would be to buy a Falcon (assuming, of course, that you
can find one) and program the 15-bit pallette-less graphics modes; then,
each pixel is just a red-green-blue triad and you can set each one to
whatever you want (5-bits each for r-g-b).

>bundle deals.

Bob,

Do we have to send in any of the 3.0x disks when we upgrade to 4.0? I found
no mention of this in the newsletter if it is so. Also, if we upgrade, will
we be getting a new manual (i.e. one complete manual)? It's very difficult
now to have to look for things either in the 2.0 manual, 3.01 manual or 3.03
documentation. If I have to add another manual to this list, I'll go batty!
Even if we are just doing an upgrade, can we order a comprehensive 4.0 manual
that has *evertything* in it?

241. Dead disk drive?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-11 22:08:48 UTC
From: ppxamp@unicorn.nott.ac.uk
Message-ID: <2gv81g$ltp@unicorn.ccc.nottingham.ac.uk>
Source record: 34952

I think that the internal 720k floppy drive in my 520 STe has died. The light comes on and the disk spins (although the speed may not be correct) but the disk A not responding error is given. It also makes a crunching noise as if it has no disk or an unformatted disk.
Is this likely to be a fault of the drive - if so what? or is it more likely to be some other bit of hardware? I dont want to buy a new drive if this one is ok. Any suggestions would be appreciated

242. Quick ST 2.2 and VDI v_curtext call

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-12 01:26:51 UTC
From: gregk@nskernel.tandem.com
Message-ID: <CJHtCs.5Jy@tandem.com>
Source record: 35120
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had Quick ST II and Laser C for a few years now. Some time ago I developed a program which uses the VDI v_curtext routine to display text on the screen. This worked fine until I upgraded from TOS 1.02 to 1.04 (or 1.2 to 1.4).

After the upgrade, only the first character is displayed when the text string contains multiple characters.

It works if I disable Quick ST 2.2.

Has anyone encountered this problem? Any ideas on what is going wrong?

I ran inte the blinking LED question with a WDSP-drive, but in the end, even the Western Digital technical hotline in California came up with the helpful information that a) production units did not always comply with the details of the technical spec's on "non-essentials", and b) they themselves did not have the blink-code interpretations since these were only used at the factory (somewhere in Asia) to weed out production defects.

Pv> drive). The disk will not boot, and in the inside a led blinks. Does
Pv> anyone know if the led gives some info about what is wrong? Or any
Pv> other way to find out what's the problem?

Sometimes the problem is that the power supply has aged (lower effective capacitance values) so that the 12V has dropped below spec's. When this happens, a drive will normally not spin up. *Sometimes* one can "kick start" the drive by manually jerking the entire drive (MF case) in a rotational sense - (easier to do than describe; hold firmly with both hands from above and 'twist' sharply 45-90 degrees conter the way the disk rotates the after power up. If you don't know which way it rotates, try both and see.) This is often referred to as "unsticking" a "stuck" drive.

I would think this is (or will be) a not uncommon problem as these MF drives get older. The fix is a new power supply unit.

There might be other causes of your problem, of course. The above is the quickest to check.

Presumably, the host card's ID# is the physical id# that the DMA sees, and in
that case one should be able to have two drives set to #0 and #1 respectively
from this card, used as logical units on the same physical.

This requires that the driver software understands lu# (common AHDI does not,
ICD and others will), and that the host card also can handle this.
This also requires proper termination, and a power supply that can handle both
drives. The 12V is most critical it seems.

|> Yes. It is quite simple - just bracket your redraw code with
|> wind_update(BEG_UPDATE) and wind_update(END_UPDATE). This should
|> effectively 'freeze' the rectangle list.

Its not that simple; consider the following two scenarios (under Multitos):

(A):

(1) My window Foo is on top and AES geneartes a scroll message for it.
My app gets the message but doesn't get as far as locking the screen.
At this point Foo's rect list consists of a single rectangle.

(2) Some app (DA) Bar decides to lock the screen & draw a dialog box
on top of Foo. This does not affect Foo's rect lists since dialog
boxes are modal.

(3) Bar finishes its dialog, ask AES for a redraw to remove its dialog box
and unlocks the screen. AES places a redraw message for Foo in
my app's message pipe.

(4) My app gets to lock the screen. It finds a single rectangle in Foo's
rect list and scrolls it with a vro_cpyfm(), copying dirty pixels
that belonged to Bar's dialog box. It then unlocks the screen.

(5) My app get the redraw massage for Foo, but since the dirty pixels have
moved, they don't get redraw.

(B):

(1) My window Foo is on top and AES geneartes a scroll message for it.
My app gets the message but doesn't get as far as locking the screen.
At this point Foo's rect list consists of a single rectangle.

(2) Some app (DA) Bar decides to lock the screen & open (or top) a window
on top of Foo. Bar unclocks the screen. Foo's rect list now consists
of all the visible parts of Foo.

(3) Bar closes its window and AES places a redraw message for Foo in
my app's message pipe. At this point, am I right in thinking that
Foo's rect list will revert to being a single rectangle?
If not when will AES get arround to coalescing Foo's rectangles,
since it has now way off knowing when my app has started (or finished)
responding to messages concerning Foo?

(4) My app gets to lock the screen. It finds a single rectangle in Foo's
rect list and scrolls it with a vro_cpyfm(), copying dirty pixels
that belonged to Bar's window. It then unlocks the screen.

(5) My app get the redraw massage for Foo, but since the dirty pixels have
moved, they don't get redraw.

Note that in both cases, at step 5 my app cannot tell whether the redraw
message was generated before it scrolled Foo or afterwards so it cannot
shift the redraw rectangle to compensate. My current thinking is that
I could set a flag after doing a scroll and if the very next evnt_multi()
finds a redraw message for Foo, I assume the worst and do a full redraw.

Any better ideas?

Steven

This may lead to a lot of additional Hardware needed I think.
As far as I know the F030 has a faster KBD chip inside (?), so you may get
some problems trying this.

By the way does anybody know if its possible to interchange the Keyboards of
MegaST <-> TT <-> MegaSTe ??

I hate the ones delivered with the MegaST, I like the MegaSTe ones much more.

So long !

253. SpeedoGDOS and NVDI, (and Lattice C?)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-12 11:00:39 UTC
From: djs@jet.uk
Message-ID: <1994Jan12.110039.12274@jet.uk>
Source record: 35132

A quick word on getting these running together: They seemed to run OK,
I had SpeedoGDOS followed by MiNT followed by NVDI in my auto folder.
However, even though GDOS support in NVDI (2.5) was disabled using
NVDIDFT.PRG, this caused some problems with Lattice GDOS detection routines
(vq_vgdos etc).

The ordering that works, and seems reliable, is MiNT followed by NVDI
followed by SpeedoGDOS.

It's also worth noting that Lattice bindings differ in several ways to
those given in the Compendium. For example, Lattice retains the old
definition of vqt_name, using vqt_f_name for the version that returns
the fsm flag.

254. GNU-C

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-12 11:24:12 UTC
From: hinsen@acds21.physik.rwth-aachen.de
Message-ID: <HINSEN.94Jan12112412@acds21.physik.rwth-aachen.de>
Source record: 35129

Recently I upgraded my GNU-C installation from 1.38 to 2.x. One of the more unpleasant consequences is that the new version simply refuses to translate some of my programs. There are no error or warning messages, but there is also no output. By doing the compilation steps by hand, I discovered that the assembler is the culprit: it finishes very quickly, but does not produce any output. Did anyone have similar problems? Is there an easy solution?

A somewhat less annoying problem is that with "b" in the UNIXMODE setting, the compiler prints error messages on lines separated only with LFs. In practice this means that I can see only the first line. Is that a bug or a feature?

Konrad.

I've purchased the "Atari Compendium", which claims to be the official Atari documentation for the ST line. I've downloaded a listing of registers for ST products. There are still essential pieces of information on the Falcon's internals that aren't anywhere to be found. For instance: Where is a block diagram of how the Falcon's internals are laid out? I've read hints and bits about a crossbar switch for the DSP and A/D converters. What's the SCC? And how do the DSP, MMU, Blitter, and CPU share the bus? And what's the pinout on the external DSP connector?

Some essential information on registers seems to be missing too. How is the volume adjusted on the internal speaker and audio output? How is the input level for the audio input adjusted?

If Atari is the only place where this kind of information can be gained, does anyone know which documents to request and their cost?

Thanks for any advice. I'm hoping that this kind of data can be found without having to register as a developer.

258. Atari Monitors

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-12 16:36:55 UTC
From: trevors@profund.demon.co.uk
Message-ID: <757441873snz@profund.demon.co.uk>
Source record: 35137

I hope this is the right forum for this kind of query.
Atari ST monitors seem to be very expensive for what they are, eg: 70
for a 12" b&w monitor, which in the PC world would buy you a 14" Colour VGA.
Does anyone know if it is possible to wire up a PC VGA (or SVGA) monitor to
an ST, and make the refresh rates compatible etc. etc.
Any help would be appreciated, even if just to point out how naively
optimistic I'm being!

Cheers
Trev

FATSPEED is the right answer IMO and I've never experienced unreliability.

I think though that I shall give up trying to persuade people as nobody seems to listen to what I am saying, they all think older TOSes = unusable operating systems.

No, I only have 2 sockets, what does it involve to convert to a 6 chip set?

;-), I used Cheetah once and never again. It ended up zapping all free space I had, like a had 7 megs free and then 0 megs free, just lucky I didn't lose files or the whole
partition.

No I think it was a version of the Easy Rider disassembler (2.1) that doesn't handle BGM partitions, not sure though.

I am going by what people have said, FATSPEED is a great i/o improvement, not quite to TOS 1.4 level but near. Anyway I did say useable, I wasn't comparing performance, I'm sure TOS 1.4 is faster but 1.0/1.2 are perfectly useable.

Waiting for a double click makes your program behave more like all the
others, anyway. And, it's also required for proper detection of drag vs.
click.

I've had a look at several other systems; almost all of them use <Alt> for menu operations.

I use <Control> combinations for any kind of controls in windows and dialog windows, including button operation, scrolling, popups, cut&paste, etc.

Ever noticed that Cut&Paste is done via <Control> in Windows (boo!), on Apple machines, Atari Falcon guidelines want <Control>, too.

Finally, <Control> combinations are much easier to access in the normal flow of typing than <Alternate> stuff.

265. Quick ST 2.2 and VDI v_curtext call

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-13 01:37:00 UTC
From: david.lewis@canrem.com
Message-ID: <60.726.4019.0N190F6E@canrem.com>
Source record: 34951

Hi Greg.

-> I have had Quick ST II and Laser C for a few years now. Some time
-> ago I developed a program which uses the VDI v_curtext routine to
-> display text on the screen. This worked fine until I upgraded from
-> TOS 1.02 to 1.04 (or 1.2 to 1.4).
->
-> After the upgrade, only the first character is displayed when the
-> text string contains multiple characters.
->
-> It works if I disable Quick ST 2.2.
->
-> Has anyone encountered this problem? Any ideas on what is going
-> wrong?

Yes, it is a bug. I pointed it out to Darek a couple of years ago. I had written a program in Laser C that was using the v_curtext routines as well. I forget the exact explanation that he gave me, but the problem went away with the next upgrade. Guess it's time for you to upgrade to Warp 9. Hope this helps.

Dave

Yes, you do need to send in your original NeoDesk Disk(s). Just one if
its one of the European double sided ones, or the Master and Extras disks in
the case of US copies distributed by Gribnif. Also make sure that you have
run REGISTER.PRG on the Master disk. (It deletes itself after running the
first time.) It does say in the newsletters that you need to include the disks
on the third of a page sheet that details NeoDesk upgrades (on the side with
the shipping weights, beside the word Important... :)

The upgrade to NeoDesk 4 includes a full manual. No addendum this time. :)

A lot of the hardware details don't seem to be available anywhere. Last time
I looked at c.s.a.s.advocacy the speed and width of the CPU bus were still being
hotly debated. Atari are following Commodore in not documenting new hardware
registers in order to reduce the backward compatibility bagage for future
machines.

The DSP hangs off the CPU bus like a peripheral via its (8 bit) host port;
it can't become a bus master. The DSP is hooked up to the A/D converters via
the "Matrix" which can connect any serial source to any serial sink.
Sources are DSP serial port, DMA play, A/D converters, DSP connector;
Sinks are DSP serial port, DMA record, D/A converters, DSP connector. The
fastest way of getting data in & out of the DSP is via the host port but
using the sound DMA is also possible. I

|> Some essential information on registers seems to be missing too. How is the

There are XBIOS calls for these; they should be documented in the Compendium
(though it's full of errors & omissions; have you read the back cover? :-).

You can get a Falcon developer kit without becoming a developer. It consists
of a slim pale blue spiral bound manual documenting the new XBIOS calls
for graphics/sound/DSP and a floppy containing Motorola's 56k assembler/linker,
a rather nice DSP debugger, docs for the 56k and examples of how to communicate
with the sound DMA and 68k from the DSP side. The latter is essential since
DSP programming and the DSP side of DSP/CPU & DSP/DMA communications are not
discussed in the manual (or anywhere else to my knowledge).

Source record: 34958

Hi!

I have a little problem with my Atari ST (still from '85!). What is it?
Well, I used to connect a monitor and a TV to my ST, and to avoid for me
to plug out the monitorcable each time I wanted to play a colourgame, (I used
the monitor for B/W and the TV for colour, in case you didn't noticed) there
was made a switch, so I only had to switch the monitor on/off. This switch
only interupted [or didn't interupted] the mono-detect signal, and if it was
interupted, the computer thought 'no monitor attached... Let's go colour at
the tv modulator...' No problem, until a certain time, I think it is half a
year ago now, that the computer didn't look at the monodetect anymore. If I
interupted it, if I didn't, if I pulled out a plug, if I putted in a plug,
nothing happened!!! The computer kept thinking that there was 'only' a mono
monitor was attached...? The guy who installed the switch didn't know what
is going on, and several other people I know don't know it either... I always
can go to a computerstore, but I think that they just install a new [???] motherboard and
say '$$$ please...!'! I have tried a new video-IC, but that didn't
help.... Doesn't anybody have ANY clue wat is happening???

I would be most grateful if someone could help me, especially because I like to
play a game once and a while, and the Jag' isn't in the Netherlands yet...

Please respond via E-Mail

Greetz,

273. More AES weirdness

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-13 11:46:16 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2h3ca8$hfd@bambam.cs.city.ac.uk>
Source record: 34954

I've noticed that user defined objects in AES object trees get drawn
as solid rectangles before the user redraw code is called. Whats more
the colour and fill pattern change with the number of colours in the mode.
With 256 colours I can't be sure AES is drawing the rectangles at all.
With 16 colours they appear as a green & black pattern.

Also when AES moves a window by blitting, the fill patterns of objects in the
window can get "out of phase" so that redraws of part of the object don't
quite match up; eg

```
* * * * * * ** * * * * * *
* * * * * * * * * * * * *
* * * * * * ** * * * * * *
* * * * * * * * * * * * *
* * * * * * ** * * * * * *
* * * * * * * * * * * * *
^ here
```

Is there anyway of changing the phase of a redraw to fix this?
One can always round the new x,y coordinates of the window to the nearest
multiple of the the patterns period before doing the move but as a user
I find this annoying.

I've read that text & graphics ought to be word or byte aligned to make
drawing them faster. However I notice that the WORKX of windows on the Falcon
are always 1 pixel in from the CURRX. Thus if you round the CURRXY to
even numbers (eg all standard pattern periodicities are even) the
contents of your window will never be byte aligned. So if you conscientious
used the chararcter snap option when designing the resource trees to be
draw in that window, you get no speed increase.

Of course if you round CURRX to 7 + 8*n this fixes the problem (at least
until new version of AES changes the window style); but then
you can never place your window flush with the lhs of the screen.
Is it wise to round CURRX to -1 + 8*n ?

Steven

How can you not know this? This kind of information is very regularly raised and the various ST magazines often refer to such things. I'm often amazed how many ST folk seem to exist in a vacuum, completely oblivious to what is available to them. This isn't meant as a slur on your knowledge, more a genuine enquiry as to how you managed to avoid the information.

276. zoo went nuts

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-13 15:47:07 UTC
From: whitema@rtsg.mot.com
Message-ID: <2h3qdr$b9a@delphinium.cig.mot.com>
Source record: 34962

I've been having a little problem with zoo on my STe. If zoo dies
or I kill it off, it leaves behind undeletable files. I've got
a 1040 style with TOS 2.06.

There are two types of undeletable files it leaves behind. The first
kind is a file of zero length. I can usually get rid of this one by
messing around with disk utilities. The second kind is the kind I'm
having problems with. When I open the directory that I zoo'ed the files
to, it says there are 1100 (yes, one-thousand, one-hundred) items, and
something like *(%' space taken up by these items. The files and folders
all are named with control characters and usually much longer than the 8+3
allowed. Whenever I try to manipulated this folder (e.g. trash, move, etc.)
I get an "Invalid Operation" dialog box. I've got an ICD case, Maxtor drive,
and ICD utilities 5.05 (I think).

Will upgrading to the latest utilities let me fix this? Will upgrading
my zoo version prevent this? Is there any way to fix this short of wiping
the partition with the disk utilities?

Source record: 34966

I am interested in upgrading my Mega STE 4/245. I can only afford
one of the following items at this time, so I list them in order of
my preference.

1) A CPU accelerator - I understand the Fast Tech Tiny Turbo
will work but have been told that they
are unavailable.

2) Memory expansion - I've see 8 meg expansion boards advertised.

3) Video card - I know about these and the NOVA is the one
I'll get if the above 2 are not available
or are not recommended.

Any information regarding other accelerators (if there are any) or
the various memory expansion boards that exist will be most
appreciated. Thanks!

I use a commercial product: LDW Power Calc. It is compatible with Lotus 123
(Ver. 2.2). It is handy and fast.

>you can never place your window flush with the lhs of the screen.
>Is it wise to round CURRX to -1 + 8*n ?

CURRX equals WORKX - 1 because the left border of a window is
always 1 pixel thick with the standard AES versions. (Btw, the
left border is the only one whose width is invariant under all
possible combinations of window element flags.) However, my
understanding of this is that windows are not guaranteed to have
a left border that is 1 pixel wide, and that the correct method
is to use wind_calc(). The snag here is that wind_calc() happily
returns negative values for small WORKX and WORKY, but the AES
don't generally support them (e.g. these are not allowed when
dragging a window). You either have to rely on the AES'
capability to accept and deal with the negative values anyway, or
correct this inconsistency yourself. Assuming the desired window
coordinates (e.g. obtained from WM_MOVED message) are x&, y&, w&,
h&, you could do:

```
SUB x&,x& MOD 8
~WIND_CALC(0,flags&,x&,y&,w&,h&,xb&,yb&,wb&,hb&)
WHILE xb&<0 OR yb&<0
IF xb&<0
ADD x&,8
ENDIF
IF yb&<0
INC y&
ENDIF
~WIND_CALC(0,flags&,x&,y&,w&,h&,xb&,yb&,wb&,hb&)
WEND
~WIND_SET(w_handle&,5,xb&,yb&,wb&,hb&)
```

If anybody knows a more elegant way to resolve this AES
inconsistency (i.e. if I'm overlooking something obvious, as
always), pleaes reply or follow up.

>encounter no problems if you only implement a WD1772-02-02 instead of
>the Ajax.I have an Ajax by myself,but that's another story...

...bare nonsense again.

Neither the AJAX nor the WD chips create any clock rates. That's what the HD addons are for; Mega STE, TT and Falcon have those integrated.

The point in using the AJAX for anything newer than DD disks is, the AJAX was designed to work with either 8, 16, or 32 MHz clock rate, giving DD, HD and ED. The WD chips were designed for 8 MHz DD mode, newer ones _might_ work fine in 16 MHz HD mode.

(Imagine an alert box from your backup program: "Backup finished - Your data might have been written to disk"...)

So, what you need is an AJAX chip, a HD floppy drive and any HD or ED upgrade module for your ST.

bye, Peter

I have recently bought an mono SVGA with ST adaptor from Ladbroke
computing.In fact it was doa (well I suspect the ST adaptor myself)
so I'm still waiting for replacement but I guess it answers your question.
Yes u can wire up VGA /SVGA to work on Atari. However, Ladbroke admitted
to me they do have to tweak the monitor, as well (presumably to get the
right aspect ratio for desktop). I think the Silica systems replacement
hires Atari monitor is a VGA with internal mods, as well.

I would like to know more about the technicalities, too.

Hmmm, Atari AHDI.PRG version 6.06 should support these (I never tried,
though), as Atari claim that Flopticals are supported; SCSI floppy drives
should act similarly.

>update your program, if there will be any future machine ... IMHO this
>is a
>"legal" way of software developement on Atari - the cookie-jar is a
>documented feature of TOS and should be used for those problems !

Right. Use the _SND cookie to determine what you have, and use the
appropriate method then.

Assignment of _SND bits are:
Bit 0 - PSG (ST compatible sound)
Bit 1 - 8-bit DMA sound (that's what STE and TT have)
Bit 2 - 16-bit CODEC (Falcon)
Bit 3 - DSP
Bit 4 - Connection matrix

On Falcon hardware, XBIOS is to be used for sound and DSP access to
maintain compatibility with future hardware.

>BTW: The registers to access the DMA-sound are _identical_ on STE,
>MegaSTE and TT !

Right.

bye, Peter

> video-IC, but that didn't help.... Doesn't anybody have ANY clue wat
> is happening???

Well, I don't know for sure, but given the way it is used, the
mono-detect is probably wired like this:

```
5V
|
+++
| |
| | pull-up resistor
+++
|
MFP <-------+-----------------------------> OUT
mono-detect
```

and then, the mono-monitor puts a little resistor between mono-detect
and ground (0V), whereas the color monitor let the pin alone.
This way, when the pin is alone, the MFP gets a 5V and a 0V (or
something close) when there's a mono-monitor. (note that changing the
shifter won't change anything because it's the MFP that detects.
Unless the problem doesn't lie in detection, but that would sound
rather weird to me). What can happen is that there's now a short cut
between ground and mono-detect somewhere in your ST. Or (more likely)
that for some reason (maybe your switch was a short-cut between GND
and mono-detect instead of using a little resistor and maybe the

pull-up resistor wasn't planned for this kind of use) the pull-up resistor died and so the mono-detect is now taken to be GND all the time. If you know how to use an ohmmeter, you should be able to check it pretty easily. Anyway, you can always try it:

add a (second) pull-up and see if it helps.

Stefan

PS: the second pull-up can be (just for the duration of the test) a short cut between mono-detect and 5V

The crunch noise is normal for:
unformatted disk
damaged disk
no disk in drive

The fact that the drive behaves differently for unformatted disks implies
that the computer has detected the presence of an unformatted disk therefore
the drive _has_ responded.
Does anyone know how the BIOS determines that a drive (disk?) is not
responding?

Peter Benie

I encountered that a long time ago with an old ST drive. It was the
belt on the drive. Some of the older drives used belts. It fell off.
The drive was trying to read it, but without it spinning, it couldn't
make head or tails of the data.

Never know......

It seems that I remember that Fast Tech was working on a board for ST/STE's to upgrade up to 14 or 15 meg. I remember asking about it because I have a 520ST (ext. power supply/drive) at home, and the case was too small to house the upgrade. The way I understand it, you need to have 4M on board already to add this memory (I could be wrong <g>).

Iain, I'd bet that the majority of ST users don't have interenet
access to learn about this stuff (and even those that have access may
not even realize this - like most college students, employees, etc).

As for magazines, I haven't seen a hardcopy ST magazine in probably
six months over here in the U.S., and even that was an import from
Europe. Atari Explorer Online is really the only source of useful
information for many of us (and STReport, for those who like that
slant on the news :-)

Sometimes we get spoiled by the amazing power of the internet, and forget
the poor souls that haven't hooked in yet ;-)

The developers were MARVIN AG. And it was not in ST-Magazin, it was a projet of
the TOS (magazine out of business since 8/93).

They only sold versions with software something like 0.3 BETA and it worked
like that.
It should enable you to get all TT modes on the ST - but only had TT-Mid with
lot of p[roblems.
Never heared anything new about it since beginig of '92

That is a well know problem with the VDI, it has nothing to do with the AES. The VDI is not capable of setting the phase of a pattern; the same problem is there for lines.

```

|> Is it wise to round CURRX to -1 + 8*n ?
|>
```

No, please dont do that! use wind_calc() to caluclate the work area of the window, then align it and calculate the new outer bounds of the window again using wind_calc(). That way you are on the safe side (who knows, maybe there will be another window manager around one day)

Hope that helps
Ulrich

You should always use WORKXYWH for snapping. But that won't always help you due to a bug in the VDI text drawing routines for byte aligned text: When comparing the outline of the text with the current clip area, the VDI makes an off-by-one error, and uses the slow textblt routines even if the text would fit exactly into the clip area. So when you know that the text fits, make the clipping area one pixel wider to the right, or turn clipping off. Of course, this only works for monospaced 8x8 or 8x16 or 16x32 fonts. But then the differences are noticable.

Does any know were I can get substitute DRAW and MOVE commands in a STOS extension?
Though I need them to be clipped, so draw to an illegal screen co-ordinate will not cause the program to crash.
It would also be nice if they were quicker than the STOS counterparts.

(Adding a second drive to a Protar 40 Hard Drive,
ref. John Trickey, 11 January 1994)

>To save me poking about to see what this card does, can anyone tell me if and
>how a second drive can be added. The how means "what scsi id is it set to".

I added a second drive in my Protar 40 some time last year, perhaps
the following may be of some interest John,

Opening the cabinet (breaking the warranty seal in the process) and
sliding the cabinet sleeve forward a few inches initially to enable
disconnection of the front-panel LED indicator cable from the circuit
board to allow full removal of the sleeve, revealed space on the left-hand
base area for a second drive, and a pre-prepared 50-way flat SCSI cable
and connector neatly secured with an elastic band.
The SCSI address of the existing drive is actually set to SCSI id = 1,
and the second drive should be installed with its SCSI jumpers configured
for SCSI id = 2, and parity disabled. This SCSI id numbering convention
is required by the host adapter, which converts the address depending on
the number shown on the number switch on the rear panel, so that with
the number switch set at 0, the drives are seen as ACSI 0 and 1; switch set
at 4 sees drives as 4 and 5, and switch at 6 sees drives as 6 and 7.
This worked O.K. for me, but I did find after a while that the second
drive would take progressively longer to spin up on power on, and removed
it again believing my particular add-on drive was asking the power supply
for more startup current than could be supplied to two drives at once.
(I did not investigate the possibility of delay sequencing the spin ups
in my particular case).

Hope the above, believed accurate and offerred on the basis of my own
personal experience and observations with my particular unit, helps

Best Regards,
Brian

MA> kind I'm having problems with. When I open the directory that I
MA> zoo'ed the files to, it says there are 1100 (yes, one-thousand, one-
MA> hundred) items, and something like *(%' space taken up by these items.
[...and much other directory weirdness deleted...]

It sounds like your directories are getting trashed. I.e. all the relevant
filename-size-date-cluster info is ... (*) ... gone...
If it is trashed bad enough, your alternative is to wipe the partition.

A possible alternative if it's only one folder and you're a bit lucky, is to
_very_carefully_ with a disk editor find the dir-sector that holds the folder
name (easiest if it's the root dir), change the leading byte in that name to
$E5 ("deletes" it), and then (not before) use checkdisk or equivalent to
analyse partition FAT and reover the then "lost" clusters (the former contents
of said folder). Of course more might be trashed than the dir, but it is a
starting point and may recover a usable partition.

As to _why_ this garbage occurs, that's another discussion.

Hi!

Again my favourite subject:

How about CD-ROM driver software for ATARI?
Especially for a TT030?

I know METADOS ang have it working for disks
in plain ISO9660 format.

That's good enough for 'GIFs Galore' and the
like. What I'm after is a driver for
ISO9660 PLUS Rockrige extensions (long filenames).

I've heared that probably the 'ICD pro' package
includes a mint xfs which does it.

I've also heared about a PD xfs which does at
least ISO9660 and may be RR ext. too.

I did not manage to find a vendor for ICDs
pro package here in germany. So can someone
tell me ICDs fax number?

And are there any pointers to the PD package
(if it exists) out there?

Uwe

> ^ here

Too true. My current thinking is to phase to the window work area. (This will
only be useful for fully blown GEM programs though). This would need offscreen
bitmaps though. Another solution is to phase to ob_x, ob_y. i think WiNX does
the latter.

>I find this annoying.

Sure is. Snapping isn't a solution as you would have to snap to 16x16
boundaries.

>I've read that text & graphics ought to be word or byte aligned to make
[.....]
>Is it wise to round CURRX to -1 + 8*n ?

What you are meant to do is use wind_calc. First snap the work area. Then
calculate the perimeter with wind_calc. If you snap higher rather than lower
IYSWIM, then you will be o.k with any boundary. Otherwise you may have the left
edge off screen.

Damn excellent questions i might add!

It would be nice if say, WINX, which seems to replace a large part of the
window manager anyway, allowed you to have MS-Windows / X-Windowing system
type borders on GEM windows to allow you to resize in any direction. Anyone
have any comments on this? I suspect most legal application should work fine
as long as they use wind_calc etc. correctly.

Yes!

Some time ago I had a harddisk and a streamer tape hooked on the internal cable.

As far as I know the internal cable and external one connect DIRECTLY.

Because of this, docs say, IF you connect units internally AND
externally, you should REMOVE the internal termination resistor packs.

I think Adam's solution is the correct approach. I just wanted to add that
under Geneva and WinX and possibly future versions of the AES, it is
possible to move a window off the left edge of the screen which means you
will get negative co-ordinates.

I have been a longtime subscriber to Current Notes here in the states, and find it invaluable. It is a great magazine, and IMHO every US ST'er should have a subscription. I cannot count the times I have responded to "where can I buy this" posts by simply looking at the ads in the latest Current Notes. Ditto for "where can I get my Atari XXX fixed" posts. They maintain an excellent PD library, and publish good articles. A large portion of each issue consists of product reviews. This magazine does not have a "everything is rosy" attitude toward reviews. If a product sucks, the review says so. This kind of honesty is refreshing in a computer magazine. Finally, Dave Small (Spectre Mac emulator, SST 680x0 upgrade) is a regular columnist.

So, if you want to keep up with ST stuff, get Current Notes. A year subscription is $27. The address is:

CN Subscriptions
122 N. Johnson Rd.
Sterling, VA 20164
(703)450-4761

If you would like to see a sample issue, I'm sure Toad computers would sell you one for the regular cover price plus postage. Their number is 1-800-448-TOAD.

I have no connection with CN, other than as a satisfied customer.

Hi,

How do I get WINX to produce the 40 promised windows? I have a Mega4
+ SM194 19" screen and some extra windows could come in handy..
(btw: I have tried all the options int the config file)

thanx,

paul

There once was a plumber from Leigh,
Who was plumbing his maid by the sea,
Said she, "Please stop plumbing,
I think someone's coming!"
Said he, "Yes I know love, it's me."

317. tcsh cursor control

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-17 00:18:10 UTC

Source record: 34896

I've installed tcsh 6.03 using 'INIT=' under MiNT 1.04, and it mostly works.
However, arrow key presses have no apparent effect.
Does anyone know how to give them their usual function? They worked
immediately when I installed tcsh on a Unix machine.

318. Marpet Xtra-RAM Deluxe

Newsgroup: comp.sys.atari.st.tech

Hello there,

when looking for a memory upgrade for my old 1040STF I noticed that in
the UK there is a board available called 'Marpet Xtra-RAM Deluxe'.
Before looking for a dealer willing to do the 'overseas-shipping' to
Germany (any recommendations?) I have some questions:

- does anybody use this board? Is it really 'plug and play' or are
there known problems?
- does it need special RAM or will standard 80ns SIMMs do?

Thanks a lot
Thomas

|> (and in GFA)?

No, the original ST shifter is too inflexible to do line doubling. On the STe you could do it using a demo-style hack with Timer B interrupts, but only if you had full control of the machine (no TOS interrupts allowed).

I can't think of any good reason to degrade to medium res in one of your own programs; if you want the lower resolution, just plot two pixels instead of one. If you're running someone else's medium res program your best bet is a colour emulator (which builds a mono representation of a colour screen every few VBIs).

Steven

321. (N)VDI weirdness

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-17 10:23:28 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2hdov0$a8v@bambam.cs.city.ac.uk>
Source record: 34898

I've noticed that the pixels you get with v_pline() vary with the clipping rectangle. So if you repeatedly redraw parts of a polyline with different clipping rectangles (say when redrawing a window) what you are left with is no longer a straight line (and occasionally contains holes).

This is because the Bresenham line between two pixels P & Q lying on the Bresenham line AB, does not necessarily coincide with the part of AB that lies between P & Q. This is a well known problem in Computer Graphics and can be easily fixed be careful initialization of the Bresenham error term in the line drawer.

Unfortunately I can find anyway of fixing this in VDI without implementing my own v_pline() which would either be very slow (a VDI call per pixel) or be very fast but cheat by hitting the screen RAM.
Are there any better solutions?

Note that NVDI is bug compatible is this respect :-(

BTW are the square markers in NVDI actually squarer than the ones in VDI or have I just been staring at the display too long...?

Steven

|> >With 16 colours they appear as a green & black pattern.
|>
|> Never noticed this, but then i work in mono.

The turned out to be because I was returning a non-zero from my redraw code.
BTW Atari Compendium disagrees with the Compute AES book (Sheldon) on the meaning of this return code.

[discussion of pattern phase problem deleted]

|> Sure is. Snapping isn't a solution as you would have to snap to 16x16
|> boundaries.

It depends on the periodicity of you pattern; with checker boards you can get away with snapping to 2x2. Unfortunately you also have to snap WORKWH as well as WORKXY if the window is scrollable so that you can scroll to the extreme right (bottom) and still be in phase.

|> >I've read that text & graphics ought to be word or byte aligned to make

|> >Is it wise to round CURRX to -1 + 8*n ?
|>
|> What you are meant to do is use wind_calc. First snap the work area. Then
|> calculate the perimeter with wind_calc. If you snap higher rather than lower
|> IYSWIM, then you will be o.k with any boundary. Otherwise you may have the left
|> edge off screen.

But is it OK to have -ve CURRXY? (in all versions of AES). I wouldn't mind losing the left edge of the window frame in order to have maximum possible work area when the user clicks on FULLER.

326. Questions from a new Falcon owner

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-17 12:57:57 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2he20l$85d@parsley.csv.warwick.ac.uk>
Source record: 34906
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello everyone!

I got my falcon last week (yeah!), and in the few days that I have had it
I have come across a number of 'oddities' that I need help on.
I have a falcon 4/127, TOS 4.04 and MTOS 1.04.

1. The manual says you can run .CPX and .ACC files from the desktop. I can't
seem to get it to work, with or without MTOS.

2. When I use the MTOS CPX to turn on memory protection, I get a 'memory
protection error. Adjust debug level...'. Why does this happen, and what does
the error actually mean?

3. When setting Compatability video modes, I sometimes get TT modes greyed
out as well.

4. Where can I find a file telling me what environment variables to
set up for GCC, and what file do I put them in. I tried GEM.CNF, but
I was not sure of the names of the variables.

Help on any of the above would be really appreciated.
Thanks,
Paul

327. Thermal problem with ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-17 13:15:55 UTC
From: qhsjoot@aom.ericsson.se
Message-ID: <1994Jan17.131555.9664@ericsson.se>
Source record: 34907

I have the following problem with my 1040ST (floppy only): When switched on it runs fine for perhaps 15-30 minutes, then when changing floppy it will die with 2 or 4 bombs and immediately reboot, bomb again, reboot etc. If I try a game disk it might manage to boot certain games but not others. If I am doing other (useful) work it could die in the middle of some file operation, sometimes corrupting the disk. When it starts acting this way, I turn it off and leave it to cool. If I then try restarting when it

has cooled a bit, it will run for a while, but not as long as if it had been turned off all night. There is nothing blocking the ventilation holes, and the machine stands directly on a desk, so there is nothing blocking anything underneath either. Some time ago I upgraded to TOS 1.4 which involved adding ROM sockets (the holes in the board were there, thoughtfully filled at manufacture with some rubbery stuff that stopped them being filled with solder, so I only had to put the sockets in place and solder)

I used the Augat variety of sockets to be on the safe side, and I have *plenty* of experience soldering (I might still have made a cold joint, of course).

Anybody have any ideas of what might cause this? Oh, and the floppy drive is new, too.

Thanx in advance, Jonas

Maybe run a "Color emulator" - you'd have essentially either ST Low or Medium res that way. There's a couple out there (not sure which is compatible with what systems, though)...

HI

I've got a MSTE 2Mb with internal Seagate157N (48MB). I wanted to take it out because of strange read/write errors. In the end only about 34 MB were accessible but getting worse. Before I took it out I wanted to format it with HDX 504 but failed ('no device found'; or the like). nevertheless I took the Seagate out and put in the Quantum240S. But all my attempts to format or to get in contact failed. I tried older versions of HDX where the WINCAP was still in use (or is it still necessary for the new versions?????). I've got AHDI 6.061.

So how can I use my f**in' harddisk????????

Please help, it's urgent. I need to work with my machine!!!!!!!!! URGENT!!!!

PLEASE MAIL.

Best regards,
Alex

I have the Frontier Xtra-RAM Deluxe which I beleive is the same beast (th company changed name).

I believe if you do have an early ST with socketed MMU and Video Shifter then the installation is solderless as advertised. You do have to clip a resistor leg or 2 to disable your onboard ram for a machine with 1meg on board I think.

If you have surface mounted video shifter and MMU chips you need an MMU adaptor and you have to solder a socket on top of the video shifter. This is actually a pretty painless operation.

When I bought mine (over 2 years ago) they shipped them ASSUMING you had socketed chips, and u have to send a piece back to get the MMU adaptor for surface mount chips. This wasn't too bad, except they shipped me an adaptor with dry joints on it. I got bored of sending bits back to them and fixed it mylsef (why do these mail order people assume they are talking to Mac droids who don't know what they're talking about!). They were very good and offered to pay to ship my machine for them to fix problem, but I (1) didn't want to loose my machine even for a few days (2) didn't want them fiddling around with my machine (when it went away for a new psu under warranty it came back minus more that 50% of casing screws!).

As for what SIMMS it will take, I'd like to know more as I;m thinking of going 4 meg.

btw I occasionally have to reseat the earth lead on the xtra-ram, especially when the temperature changes a lot.

I belive a recent poster here gave the Marpet email address

333. gdb for Falcon/MultiTOS??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-17 18:18:29 UTC
From: saj@chinet.chinet.com
Message-ID: <CJsDIu.Mop@chinet.chinet.com>
Source record: 34914

I'm trying to port a somewhat large and not totally well-behaved application from Mark Williams C (and an ST/Mega target machine) to gcc and a Falcon030 target machine. I have it to the point where it compiles and links, but it dies on start-up (taking MultiTOS with it...reset time). So far so good.

I compiled it with the -g switch to gcc and ran sym-ld on the objects to generate a symbol file. But when I try to use gdb (just fetched from clausthal), the machine crashes hard in response to the run command. Well fine...I'm always more surprised when a debugger works than when it doesn't, but I'd like to get this finished. So anyone care to suggest some things I should be trying? Am I going to have to compile up a gdb special for my machine (but how would I debug that???)? Any commonplace auto folder programs incompatible with gdb?

Again, I'm in a hurry, so I'm asking BEFORE breaking my brain on the problem. If there's some simple mistake you think I might have made, please tell me.. it could well be the explanation.

Thanks.
Steve saj@chinet.chinet.com

I'm not sure what you're asking for. If you want to switch to
medium res, you might try ~XBIOS(5,L:-1,L:-1,1) (that's
Setscreen()), but remember, this will screw up the VDI and the
AES, so this won't be too useful. You might also try to open a
virtual screen workstation with work_in[0] set to 3. I have never
tried this one.
If you want to restrict graphics output to some rectangle that is
200 pixels high, you'll have to use VDI clipping:

```
INTIN(0)=1
PTSIN(0)=0
PTSIN(1)=0
PTSIN(2)=639
PTSIN(3)=199
VDISYS 129,1,2
```

restricts graphics to the upper half of a standard ST high screen.

I hope you can use this info.

|

I have one - I didn't install it myself, but the guy who did it for
me made it look pretty straightforward. The installation manual comes
with detailed descriptions for all Atari models; it shouldn't be too
hard to do you it yourself.
As for the SIMM's the manual states:
Buy either 1/4 MB or 1 MB capacity SIMMs (256k*8 or 258*9 or 1 MB*8
or *9)
Always buy SIMMs in pairs
Never mix SIMM capacities
Paired SIMMS must have the same speed

I think 80 ns SIMMS will do fine.

Good luck,

Paul

> - does it need special RAM or will standard 80ns SIMMs do?
>

I have a marpet ram upgrad in my mega-2 and it mostly works ok. the
only problem that I have noticed is that sometimes I get video noise
when the upper 2 meg is accessed. It does use standard simms, I got
mine from a mac owner.

however, I feel that you should be warned that the upgrade uses
a bed-of-nails approach for the mmu connection. This means that I will
have to replace my mmu socket if I ever remove the marpet upgrade
since installing the upgrade pushed a bunch of pins through the bottom
of the socket.

I suggest you find another upgrade route.

341. MIDI programming

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-18 13:13:37 UTC
From: berrah@litsun.epfl.ch
Message-ID: <2hgna1$ci0@disuns2.epfl.ch>
Source record: 34921

```
--
I'm trying to use the MIDI port in C language. I correctly connected
the MIDI OUT port to the MIDI IN port, used the Midiws(char *data, int cnt)
procedure to send a characters stream to the midi port, and after a while
(2 sec.), I used the struct iorec * Iorec( int device) with device == 2
for the midi port. The structure allowed me to know that the midi buffer
is 128 bytes long, but the head and tail indexes were wrong (the buffer is
a circular buffer). I've read somewhere that the buffer is filled with an
interrupt routine. Do I have to write this routine ? Do I have to initialise
the ACIA ? (master reset, initialise the command register, allow interrupts)
If I have to write an interrupt routine, were is located the corresponding
vector (interrupt from the MIDI ACIA). I have a TOS 2.06 on a STe.

Any help appreciated. Thanks

Clarence obviously have some kind of a problem. The posting has gone to just about every group there is (well, almost :). If you feel like making something of it (i don't), mail root@ whatever clarence's email adress is, and ask them to tell clarence never to do that again. But it probably won't help. Clarence is very convinced, it seems. Clarence also believes that he is doing the right thing, telling eveybody this. Or perhaps Clarence just want some attention. He got it.

I just realized that I am not making anything better by posting a follow-up that probably looks like a lot of other followups to other groups. So I'll stop right here (apart from a .sig)

Hi,

Ok, so there's been lots of talk about Geneva recently, two ST mags (UK) reviewed it and thought it was great for ST's - well that's how I read it anyway :-) . My question is can it multitask TOS programs as well as GEM thingies ? How about compatibility with MiNT and then using TOSWIN to run things ? I'm a little lacking in knowledge about this sort of thing really - any info. greatly appreciated.

Thanks,

Martin

Geneva is every bit as good you say the mags say it is (I haven't read any print reviews...I just went out and bought it ;-)). Geneva will run TOS programs using a program called GNVA_TOS, which works a lot like TOSWIN in that it puts the TOS program in a window, and you can chage the font, etc, etc. However, you can only multitask programs which read the keyboard regularly, so you can't stick, say, a ray-tracer in the background like you can with TOSWIN and MiNT. Text editors and term programs and suchlike should work fine, though.

I'm sorry, but I don't get the point of your problem. Is it that you don't
manage to get anything sent out the midi-port? Anyway, for normal sending and
receiving it's not necessary to install your own interrupt routine. You might
however want to install your own midi-buffer since the 128-byte buffer is
fairly small.
I've never had problems with sending or receiving midi-bytes. If you're able
to describe your problem a little more precise, I might be able to help you
out. Post or email.

I agree that many of the hardcopy U.S. ST magazines have fallen by the wayside, but what about Current Notes and ST Informer? They continue to publish on a monthly schedule (10 times/year for CN). In my opinion, CN is well done and a good source of information. STI is OK too. I support both by subscribing.

If people keep complaining that there are no U.S. magazines, instead of subscribing to the few remaining that do exist, pretty soon they'll be right and there will be none left.

Wrong in what way? did you check the contents of the buffer? how many
bytes were you sending?

> I've read somewhere that the buffer is filled with an
> interrupt routine. Do I have to write this routine ?

Not unless you're unhappy with the TOS one (see below).

> Do I have to initialise
> the ACIA ? (master reset, initialise the command register, allow interrupts)

No. You read the incomming data with the appropriate BIOS (not GEMDOS) call.

Since you transmitting at close to full MIDI bandwidth (Midiws)
it's quite possible that you're losing MIDI bytes due to overruns on the
ACIA; the TOS MIDI handler can find itself locked out for too long by
other MFP handlers; this is especially so on 8MHz machines with TOS >= 1.4.
Pro MIDI companies like Steinberg/Emagic/Dr T reimplement a large
part of TOS in their products for just this reason.

Actually as a data source MIDI is a bitch; It can't be handled by DMA
(like disks are) since you may want to time stamp each byte or so.
Yet at 31.25 Kbaud its faster than most interrupt driven sources and needs
access to the processor every 320us to function reliably.
Incidently I've heard that '386 PCs under Windows 3.1 and certain Apple
Powerbooks can also drop MIDI bytes at high data rates even though these
machines have better hardware buffering on their MIDI ports and faster
processors.

I assume you mean move it from within a program. Normally you wait for your app to be sent a WM_MOVED message for the window and then do a wind_set(handle, WF_CURRXYWH, x, y, w, h) to move the window. AES will copy the contents and send redraw messages to your app if redraws are necessary.

I can't see any reason (other than poor GUI design) why you shoudn't do a wind_set(handle, WF_CURRXYWH, x, y, w, h) without getting a WM_MOVED from AES first.

>The turned out to be because I was returning a non-zero from my redraw code.
>BTW Atari Compendium disagrees with the Compute AES book (Sheldon) on the meaning
>of this return code.

i understand it to apply some state modifications, with d0 being the bit flags.
i do not know how it would deal with 3D objects for instance. i have not seen
the Compendium, so what are the discrepancies?

>|> Sure is. Snapping isn't a solution as you would have to snap to 16x16
>|> boundaries.
>
>It depends on the periodicity of you pattern; with checker boards you can get
>away with snapping to 2x2. Unfortunately you also have to snap WORKWH as well
>as WORKXY if the window is scrollable so that you can scroll to the extreme right
>(bottom) and still be in phase.

Yes, i took that at read. But you must also take into account that there is no
guarantee that a VDI pattern will remain as you expect. For instance my Reflex
graphics card replaces some flickery patterns with others. So to be safe you
must always take the periodicity to be 16x16. In any case, it is not the done
thing to snap on the vertical axis. As i see it the only correct solution is to
phase to a reference point in the GDP. i mean that in a general sense, not just
the standard GDPs. A half way house would be to phase to the window work area,
but that would then break if you were moving 'GDPs' w.r.t the work area. This
would mean however that you could not, for instance, redraw a pattern background
by drawing a vr_recfl() with the current window rectangles. But instead you
would 'draw' the whole pattern each time clipping to the relevant rectangle. i
guess it would be interesting if objects could accept phasing parameters, as
has been suggested, for this would give you complete control, and allow some
neat animations. But an implicit phase0 would suffice.

>But is it OK to have -ve CURRXY? (in all versions of AES). I wouldn't mind losing
>the left edge of the window frame in order to have maximum possible work area
>when the user clicks on FULLER.

To the best of my knowledge, yes. But it is not my preference.

Adam.

Wich programming language do you use ?

>it, but that seems a bit cac-handed. Also, how do you copy the window's
>contents to the new position?

If you are programming in 'C' you just have to write:

wind_set(handle,new_x,new_y,new_w,new_h);

handle ..... the window's AES-handle
new_x, new_y, new_w, new_h .... the new position and size of the window

That's all ! You need not to copy the windows content's to the new
position.

This board connects onto the shifter & memory controller chips, using push on adapters. I purchased one of these several months ago. After some initial problems with broken solder joints on the shifter adapter, I got it working. It has worked well since. However, if (for some reason) you ever wanted to remove it, the push on adapter on the memory controller disturbs the pins in the socket, leaving problems with bad connections if you remove the adapter.

In summary, if you get it, you will be stuck with it.

Yes, ordinary SIMMS work fine (I used 70 ns).

>Err, help! What's the procedure for moving a window? I can close it and reopen
>it, but that seems a bit cac-handed. Also, how do you copy the window's
>contents to the new position?
>

If 'w' is your window handle and 'x/y/w/h' are the new *border*
location and dimensions of the window,

wind_set(w, WF_CURRXYWH, x, y, w, h)

The AES will blit the contents across for you, and generate redraw

Thanks for your answer. My problem is that when I send for example 20 bytes, the
structure returned by the call to the Iorec procedure, used to get informations
about a buffer (keyboard, RS232 or MIDI port), contains buffer indexes that do
not show me that 20 bytes have been received, i-e the head index == 0 and the
tail index == 127 !? just before sending 20 bytes, the two indexes were == 0.
As said by Steven Eker, it could be due to the fact that some interrupts from
the MIDI ACIA are lost due to higher interrupts relieving to the MPF.
So, which procedures are you using to send and receive bytes trough the MIDI
port ?

|> > for the midi port. The structure allowed me to know that the midi buffer
|> > is 128 bytes long, but the head and tail indexes were wrong.
|>
|> Wrong in what way? did you check the contents of the buffer? how many
|> bytes were you sending?

For example, after having sent 20 bytes, with a 128 bytes long buffer,
the tail == 127 (ibuftl field) and the head == 0 (ibufhd field). Don't
you think that some something is wrong somewhere ?

|> No. You read the incomming data with the appropriate BIOS (not GEMDOS) call.
|>

Can you, please, indicate me which procedures to use (I'm a beginner with atari,
and there are so many procedures ...) ?

|> Since you transmitting at close to full MIDI bandwidth (Midiws)
|> it's quite possible that you're losing MIDI bytes due to overruns on the
|> ACIA; the TOS MIDI handler can find itself locked out for too long by
|> other MFP handlers; this is especially so on 8MHz machines with TOS >= 1.4.
|> Pro MIDI companies like Steinberg/Emagic/Dr T reimplement a large

|>
|> Actually as a data source MIDI is a bitch; It can't be handled by DMA
|> (like disks are) since you may want to time stamp each byte or so.
|> Yet at 31.25 Kbaud its faster than most interrupt driven sources and needs
|> access to the processor every 320us to function reliably.

Do you mean that it would be better to disable interrupts and use an active
waiting procedure ?

|> Incidently I've heard that '386 PCs under Windows 3.1 and certain Apple
|> Powerbooks can also drop MIDI bytes at high data rates even though these
|> machines have better hardware buffering on their MIDI ports and faster
|> processors.

Hah ! Interesting. In fact, I want to use the MIDI port at 500Kbaud (i-e clock/1)
But I see it's quit not possible. Is it possible to disable the MPF interrupts
without disturbing too much the system ? I just need to make HDisk accesses
by a remote host (C64, yes don't laugh ...) via the MIDI port.

Karim

I have the previous incarnation (Xtra-RAM without the "deluxe"). Marpet gave
me very good customer service: my 1040STFM has a surface mounted MMU, and
they happily replaced the MMU adapter with one that would fit (even though I
bought the memory card second hand!)

Then it turned out my MMU couldn't handle memory banks with uneven sizes
(I was aiming for 2.5MB): Marpet diagnosed the problem and talked me through
a track-cutting and rewiring exercise on the MMU adapter that eventually got
me a working 2MB system. If you tell them you can handle a soldering iron
properly, they will give you detailed technical help.

Since then, the board has performed flawlessly.

>In summary, if you get it, you will be stuck with it.

True. But why would you want to remove it?

Did you try to get them from an application, NOT from the Desktop ?
The original Desktop, only uses 4 (or 8, depends on the version) windows.
This number is hardwired and won't change even if there are more windows
available.
(ecxeption: Newdesk for MultiTOS and maybe some other versions)

From your article, I reckon that you use GEMDOS for MIDI i/o. I think you'd
better use the plain ol' BIOS, as I vaguely remember running into trouble
myself while experimenting with the GEMDOS routines. Simple Bconout() and
Bconin() routines will do anything you want them to do, without serious
trouble. The only thing I sometimes encountered was a few lost MIDI bytes
(which can be quite annoying). That means that to be safe, you always have to
perform some check-thingy someway.
However I never bothered with the head and tail indexes of the iorec -- they're
not too relevant for ordinary programming. Only when installing a larger
midi-buffer you have to set them to 0, if I remember correctly. If you want a
piece of source re: installing custom midi-buffers, drop me an email and I will
dig up some code.
As for plain midi i/o (once more), use BIOS, for example like this:

```
char midi_in( void )
{
return (char) (Bconin(3) & 0x000000FF);
}

void midi_out( char c )
{
Bconout(3, c);
}

int midi_stat( void )
{
return Bconstat(3);
}

void midi_clear( void )
{
while (midi_stat())
midi_in();
}
```

... etcetera ...

good luck,
Hendrik Jan

Thats assuming you have SOCKETED MMU and Video Shifter. If they are
surface mounted/soldered in you have to (or did when I got mine 2 years ago)
(1) ship the socketed MMU adapter back and wait for surface mount MMU
adapter to be sent to you (2) SOLDER the socket that comes for the shifter
ontop of the shifter chip.

|initial problems with broken solder joints on the shifter adapter, I got it

yeah I had problems with flakey solder joints on my surface mount MMU adapter.
By then I'd got so bored with sending bits off (first to swap MMU adapter,
then when it didn't work they asked me to ship DeLuxe board and SIMMS (but not
MMU adaptor)to test) to them I fixed it myself

Yes, you can. You'll have to plug terminators into the TT board when you
have no externally connected drives. The last device on the internal chain
must have terminators, too.

Does this mean you can have a pair of say 80ns and a pair of say 70ns SIMMS in the same XtraRam Deluxe board? I am interested as I want to upgrade 2meg to 4 meg sometime.

Also, has anyone tried the STE 2.5mb fix with the XtraRam Deluxe with 2*1mb and 2*256kbyte simms?

I've never noticed this behaviour, in any TOS version from 1.00 to
MultiTOS.

>Also when AES moves a window by blitting, the fill patterns of objects
>in the
>window can get "out of phase" so that redraws of part of the object don't
>quite match up; eg

That's "normal", since VDI patterns have a fixed phase. Solution 1: Don't
use fill patterns in objects; Solution 2: Snap your window's upper left
corner of the work area to a 16 pixel boundary in X and Y direction.
Compute the snapping on every "size" or "move" the user does.

>I've read that text & graphics ought to be word or byte aligned to make

>draw in that window, you get no speed increase.

What's the problem? Snap your work area to the desired boundary (8 for
windows doing text display with the System font and 16 for general VDI
output, see above), then have AES calculate the CURRXYWH via wind_calc().
>
>Of course if you round CURRX to 7 + 8*n this fixes the problem (at least
>until new version of AES changes the window style); but then

Use wind_calc() for full compatibility.

Oh well, I think I should think a little more thoroughly before I write nonsense. It is, of course, entirely impossible to set an ST-high monitor to ST medium resulution with any software trick (short of writing an emulator).

>clipping rectangles (say when redrawing a window) what you are left with
>is no longer a straight line (and occasionally contains holes).

I have found that larger holes almost exclusively arise at the
borders of clipping rectangles, and that this happens only with
lines that have a small slope. For instance, if you want to draw:

```
scan line # | screen
+----------------------
0 | ****
1 | ********
2 | ****
```

and you draw this with two identical v_pline() calls, one with
the clipping rectangle set to (0, 0, large_x1, 1), and the other
with te clipping rectangle set to (0, 2, large_x2, large_y), you
will get:

```
scan line # | screen
+----------------------
0 | ****
1 | **  **
2 | ****
```

Unfortunately, I haven't been able to come up with a fix for
this. I don't even have an algorithmic explanation to offer.
Oddly enough, this doesn't happen on vertical rectangle borders
with very steep lines.

>This is because the Bresenham line between two pixels P & Q lying on the
>Bresenham line AB, does not necessarily coincide with the part of AB
>that lies between P & Q. This is a well known problem in Computer Graphics
>and can be easily fixed be careful initialization of the Bresenham
>error term in the line drawer.

Thanx for this explanation. I recently fooled around with a
"quixlines" animation I had hacked up, and found that there were
always some lines that were not properly undrawn when I moved
another window into the quixlines window. Now I know why that is,
at least, and I'm glad it's not a bug in my program that I failed
to figure out...

384. GEM VDI vro_cpyfm Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-19 21:04:11 UTC
From: gregk@nskernel.tandem.com
Message-ID: <CJwAJ2.DyG@tandem.com>
Source record: 34759

Hi,

I'm writing a terminal program in Megamax Laser C, using the VDI routines
for screen output.

Using some examples that come with Laser C, I was able to perform scrolling
up with the following code:

```
rect_set(&pxyarray[0], 0, CELL_H, COLUMNS*CELL_W, (ROWS-1)*CELL_H);
rect_set(&pxyarray[4], 0, 0 , COLUMNS*CELL_W, (ROWS-1)*CELL_H);
vro_cpyfm(handle, S_ONLY, pxyarray, &source, &destin);
```

where CELL_W and CELL_H are defines which point to attrib[8] and attrib[9],
COLUMNS = 80, ROWS = 24 and S_ONLY says use the source bit map only.

The above code works fine. When I wanted to do the reverse, ie. scroll down,
I used the following (similar) code:

```
rect_set(&pxyarray[0], 0, 0 , COLUMNS*CELL_W, (ROWS-1)*CELL_H);
rect_set(&pxyarray[4], 0, CELL_H, COLUMNS*CELL_W, (ROWS-1)*CELL_H);
vro_cpyfm(handle, S_ONLY, pxyarray, &source, &destin);
```

This has no effect - the screen remains unchanged. I looked at the pxyarray
after the rect_set calls, and it seems to be set up okay.

I also tried left and right moves - the right move worked and the left move
didn't.

I'm at a loss as to why this is not working. Any ideas? Am I doing something
wrong, or have I hit a bug?

I have a 1040STfm with TOS 1.04, and LaserC 2.1. Note: with VDI I'm using
alpha text mode via the v_enter_cur call.

Cheers, Greg.

* * * * IN SEARCH OF "ROLLING RONNY" !!! * * * *

A little less than a year ago, I purchased an Atari 1040 ST computer which also came with game software. Recently, I and my godchildren have been playing the demo version of the game "Rolling Ronny" and we have really enjoyed it. The demo version was part of a "Cover Disk" which accompanied a 1991 issue of the ATARI ST magazine (???).

I am interested in knowing 1) whether or not the full running version of this game was ever manufactured and, if so, 2) where I can legally purchase/ obtain a copy of this game.

If you have any information on "Rolling Ronny", please feel free to contact me via my e-mail address

etcoles@mwvm.mitre.org

Thank you very much in advance and have a nice day.

>the ACIA ? (master reset, initialise the command register, allow interrupts)
>If I have to write an interrupt routine, were is located the corresponding
>vector (interrupt from the MIDI ACIA). I have a TOS 2.06 on a STe.

Well, for real speed while teh mouse is moving and such you will need
to rewrite half the OS (all teh keyboard intterrupts). I bet you don't
care about getting a full 32Kbps with GEM on an old 8Mhz system so
you can start playing with the BIOS. Bconin/Bconout kind of stuff. Device
3 is the MIDI port. That MIDI string sending thing is kinda lame because
there is no INPUT counterpart and its INPUT that needs a good block IO
call since its input (a large MIDI dump) that has a danger of overflowing the
buffer and dropping characters.

Use IOREC to install a larger buffer if you like 128 bytes is small.
I'd go for 4K or even the full 31K.

You Might want to run MiNT too. MiNT allows you to redirect the MIDI
input and output (each separately) to different devices, files, or pipes.
That means that you could (theoretically) pipe the MIDI output of band-in
-a-box to your sequencer with the real MIDI in going into band-in-box and
real MIDI out from teh sequencer. Or whatever weirdness you want to do.
I haven't tried large buffered Fread/Fwrite calls on the MIDI ports, but
it IS a standard redirectable handle. In fact, I HAVE used Fwrite on MIDI -
for sending MIDI presets to my RACK.

In article <CJtuvx.D4E@bbc.co.uk> dwhite@rd.eng.bbc.co.uk (David White) writes:
>Err, help! What's the procedure for moving a window? I can close it and reopen
>it, but that seems a bit cac-handed. Also, how do you copy the window's
>contents to the new position?
>
>D.White.

When you get a WM_MOVED message call wind_set (window_handle, WF_CURRXYWH,
mb[4], mb[5], mb[6], mb[7]); where mb is your AES message buffer.
The AES will move your window for you, including data, but you may get a
REDRAW message if more of your window is exposed than before or something.
So, just continue with your evnt_multi loop after calling wind_set.

388. Falcon Adaptor

Newsgroup: comp.sys.atari.st.tech

Any E-mail for me (Dave) should be headed "To Dave"

This may be of interest to anyone with a Falcon AND a low range Multisync monitor. By low range I mean one which has a horizontal frequency of between 16KHz and approximately 40KHz. See my previous letter on Comp.sys.atari for more details. I am offering a service of modifying a standard VGA adaptor for the Falcon. The modification involves adding a switch to the VGA adaptor which will allow the user to change between VGA and RGB modes without the need to remove the one adaptor and replace another of the other type (VGA or RGB). The modification if very simple and can be done by anyone who is capable of a small amount of soldering. If you want to modify your adaptor yourself I have seen an instruction file on some FTP sites called FALCADAP. This provides the necessary details. I must stress I am not the author that piece of infomation, I am just offering to modify the adaptor for people who do not wish to make the modification themselves.
The service will work as follows: You will post me your VGA monitor adaptor with five pounds sterling (6 pounds outside UK) and I will make the modification, pay for the components and pay return postage out of the money. Within 1 week at the latest (depending on how many people want the modification) will post the modified adaptor back to you. It will now incorporate a switch on the top which, when switched, will change the type of monitor connected. So if you then change resolution or re-boot you computer will be in VGA mode if it was in RGB mode previously or vica versa.

Note: This article is by Dave Haider not Paul Booth.
Any E-mail for me (Dave) should be headed "To Dave"

This letter may be of interest to anyone with a Falcon in EUROPE
(mainly the UK) who is NOT a member of the Falcon Fact File.
The reason for that is because this as an ad. for the Falcon Fact
File. Based in the south of England, and run by a
Non-profitmaking organisation, the Falcon Fact File offers free
membership to anyone in England or Europe. FFF (Falcon Fact File)
offers you the chance to help establish a good user base for your
computer. If you sent a stamp and your name and address to the
address below you will receive a membership form. Once you have
filled that in you should return it to said address with another
stamp and a blank high density disc. In a few days you will then
receive your disc back full of PD and containing Namenet, a
datebase compatible with the Falcon. On the database you will
find all the names of all the other Falcon users who are members
plus the configuration of their machine, the hardware peripherals
they have and what software they use aswell as their address and
telephone number and E-mail address if theyhave one. All Falcon
related companies, some offering special offers to FFF members,
are also included on the database. Therefore if you have any
problems or just want Falcon contacts you are free to ring any
of the members at a reasonable hour for a chat. The Namenet
software allows filtering of members so it will select people
with configurations similar to yourself who are likely to be
able to help. I urge you to join, it is in the best interest of
all of us. If you know other Falcon users please pass this
infomation on to them and urge them to join also.

Just readin through a copy of ST Review (only ST mag on the shelves!) and I noticed a reivew of the Falcon-Wing. It says that 4 and 14.3(16mb) are the only real options as an 8 meg config slows things down due to the Falcon's MMU. Is this a load of bollocks, or is this true - I have 4, would like 8, can't afford 16mb .....

Karl.

> there known problems?
> - does it need special RAM or will standard 80ns SIMMs do?
>
>Thanks a lot
>Thomas
>
>
I have an Atari STFM that I upgraded to 4Mbytes using an Xtra-RAM
deluxe board. It has worked well for me, but it was tricky to install.
The system uses a special plug that shares the MMU socket with the MMU,
and I found that the pins on top of this plug had to be trimmed down, and
covered (insulated on top). These pins were shorting out against the
shield under the keyboard. There are many different layouts of the STFs,
so not everyone will have the same problems that I found.
The kit is described as being 'solderless', and includes 4 wires
with clips on each end for connecting the memory board. I found it best
to actually solder jumper wires in, rather than use these clippy cables.
For a normal 8 MHz 1040ST machine, 80 ns DRAM SIMMS would be more
than adequate.
I do not know of any companies that ship the memory board to Germany
(have you contacted Marpet directly?).

Hope I helped,
Dave

Source record: 34870

Hello

I bought the modem for DATEX J from german TELECOMM for my ST (TOS 2.06).
Even if I want to use it mainly for DATEX J, I've tried to use the fax-option.

The modem is from "CREATIX" and accepts Haeyes and V.25bis.

I've tried HACKFAX 1.1, but it only responded: "Modem problems?".
I know the modem is not a Zyxel. Maybe the problem is, that 19200 Baud are
not available (max. 14400)

COMA150 dialed and connected, but the modem hung up, when getting parameters.
The last command in the modem-log was : "AT+FET=2"

Another point on COMA is, that I actually don't know, if I'm really willing to
spend 100,-- DM for FAX.

Does anyone have a solution or at least more information?

Regards

Helmut

I have been tryting to get a conner CFA 340S hard drive to work with
a Falcon that has no internal IDE drive. Sometimes the drive works ok
but 90% of the time, the falcon sends a message to the drive, the drive
locks up and doesnt start working again until I reset the computer.
The drive locks up after the second disk drive access after the fuji
symbol appears.

Has anyone goty any idea what could be goung wrong.

The falcon tos is 4.01.

Yours

Graeme Mathieson.

The main culprit is the IKBD. Unfortunately it shares the same vector as MIDI
and there is an additional problem in that the MPF chip is edge triggered while
ACIAs provide level triggering. You can however tell the IKBD to shut up by
sending it an appropriate message. This almost completely fixes the problem
but means you lose the keyboard/mouse/joystick. Still this trick is used on
some budget commercial MIDI software.

The other culprit is timer C. The 200Hz timer routine is fine, but once every 4
interupts the 50Hz house keeping routine is called. With some versions of
TOS this is just long enough to cause overruns on the MIDI ACIA. However
these occur very rarely so you can probably ignore them.

Disabling the housekeeping for any length of time is unwise.

If you want to do networking via MIDI I suggest to stick to the BIOS calls and either disable the IKBD while receiving or implement you own error checking/retransmit protocol or both. Messing with the interrupts is a tricky business.

Hi

I am looking for corresponding GDOS Fonts for my monochrome Monitor and
my NEC P6plus connected on my MegaST4. As I am shure that there is someone
out there having the same configurationm, who has already installed GDOS
I thought of posting this question on the net.

Who can help me finding some corresponding Fonts??

Every information is helpful

Please e-Mail me because I don't have the time to read this group very often.
My e-Mail address: frog@stud.ee.ethz.ch

Thanks in advance
Martin

If you want your program to work on all machines, you should use the VDI.
Alternatively, you can use LineA which is faster, but will not work with
most gfx cards. If you write directly to the screen then your program will
only work at 640*400 res or whatever you decide.

Contrary to popular wisdom, the VDI is very fast if you have Warp9 or NVDI
installed.

>to the window. But when using AES commands (eg, "wind_create") this is not
>done, and I can't find it anywere in the manual. Could someone tell me how
>it's done?

It can't be done. You have to obtain the origin, width and height
of the window and adjust your coordinates accordingly.
Unfortunately, to be able to do so you have to refrain from *any*
OPENW call, as these modify GFA's internal coordinate origin, as
you have noticed. Don't even use OPENW 0 when displaying a menu,
although this is recommended in the manual -- if you stick to
using windows and only plotting graphics to them, your menu bar
won't get messed up by any graphics output.
When redrawing a window, the correct way to do this is (at least,
this is how I do it -- correct me if I'm wrong):

```
WIND_GET(0,4,dw_x&,dw_y&,dw_w&,dw_h&) ! get background window info
...
'actual redraw code:
WIND_GET(wh&,4,x0&,y0&,w0&,h0&) ! get window workspace
WIND_UPDATE(1) ! freeze screen and rectangle list
WIND_GET(wh&,11,x&,y&,w&,h&) ! get first rectangle
WHILE (w&>0 OR h&>0)
IF RC_INTERSECT(dw_x&,dw_y&,dw_w&,dw_h&,x&,y&,w&,h&)
IF RC_INTERSECT(x0&,y0&,w0&,h0&,x&,y&,w&,h&)
@vs_clip(x&,y&,PRED(ADD(x&,w&)),PRED(ADD(y&,h&)))
FOR i&=1 TO PRED(w0&)
LINE x0&+PRED(i&),y0&+@somefunc(PRED(I&)),x0&+i&,y0&+@somefunc(i&)
NEXT i&
POLYLINE 10,x&(),y&() OFFSET x0&,y0&
TEXT x0&+10,y0&+20,"I am a test window"
ENDIF
ENDIF
WIND_GET(wh&,12,x&,y&,w&,h&) ! get next rectangle
WEND
WIND_UPDATE(0)
'
PROCEDURE vs_clip(x1&,y1&,x2&,y2&)
INTIN(0)=1
PTSIN(0)=x1&
PTSIN(1)=y1&
PTSIN(2)=x2&
```

```
PTSIN(3)=y2&
VDISYS 129,1,2
RETURN
```

This is for redrawing the window with handle wh& entirely. If you process a redraw event, you only need to redraw the rectangle specified by the last four elements of the AES message buffer, and you don't have to walk through the rectangle list. Beware, though, the rectangle specified in the message buffer includes the border decorations, so you still have to RC_INTERSECT() against the window workspace.

I hope you can use this info. Feel free to email me if you have more questions.

PLEASE, DO NOT DO EITHER OF THE ABOVE!

i.e. *don't* use Line-A, and *don't* write directly to screen RAM. These are two of the easiest ways to guarantee that your code will not work on anything but the machine-type you wrote it on. Please, use VDI text and a screen accelerator instead. Unless, of course, the program is for your own use only, in which case go right ahead and write to the screen - the address is returned by the physbase() XBIOS call.

From: rdt154k@monu6.cc.monash.edu.au
Message-ID: <2hng97$77e@harbinger.cc.monash.edu.au>
Source record: 34884

System;

Mega ST4, ICD AdSpeed, Quantum LPS52S, Version 6.0.2 software.
Cache size is set to 60k and write verify is on. TOS 1.02.
Partitions are F: 16Meg, E: 16Meg, D: 16Meg C: 4Meg

Question:

Copying files from one partition to another, file size 50K~,
from F: to E: takes about 4-6 seconds.
I think that this seems way too slow, I cannot work out what
the problem could be.
Moving files takes even longer, at times up to 10 secs for the
same size file.

Any suggestions would be most appreciated.

I tried to put one in my 520ST (no f, no m <g>). I never could quite get it to work properly. The manual however makes no mention of the original 520ST, it assumes a minimum of a 520STf. I finally swapped the XTRA Ram Deluxe for a plain old XTRA Ram, and I now have a 1 Meg 520ST, that will soon be upgraded to 2.5 Meg. I've had no problems since.

...
>Some time ago I upgraded to TOS 1.4 ...

Well, this may NOT be the problem, but some of the early machines had a problem of the TOS chips "walking" out of their sockets. I have an original model 520ST at home, and I have had this problem. When I have it, the results are basically what you described above. The problem usually manifests itself when I move the computer. The solution in the early machines was to reseat the ROMs. Since you added your own sockets, I would go over the solder connections first as you suggested. If all looks good there, firmly press each of the chips into its socket. You'll probably find one that will "pop" as it reseats in the socket. If this is your problem, you may have to do it several times before your computer will work flawlessly, but the occurences of this problem should space out eventually to infinity! (until you move the computer again! <g>)

This "walking" problem is related to heat as you guessed. The chips get warm when power is applied (this is normal), and they expand. When they cool, the shrink back to normal size. This process causes the chips to ease themselves out of the socket unless they are firmly seated.

Sorry to get so long winded <g>. I hope this fixes your problem.

This sounds like the cause of your speed problem. It is my understanding that TOS 1.00 and 1.02 were notoriously slow with hard drive access. You can upgrade to 1.04 (and get some added features as well as better speed), or you can use some patch programs. FATSPEED is supposed to do the most good for hd access on older TOS's from what I hear. I will find out soon as I am getting a hard drive for one of my TOS 1.00 machines.

Hi,

I wrote this article. The board has been tested with 4*2MB SIMMS and
according to the distributor was found to be too slow among other
unspecified problems.

So far I have not seen any products that can take 8MB, except possibly to
the Eagle Sonic which adds Alternative RAM. This product is very
dissapointing anyway. I will be happy to hear that 8MB is possible, but so
far, everyone I ask say it's not.

Try FATSPEED.PRG. It is PD or Freeware and available from most ftp sites.
Better still, upgrade your TOS version which is at the root of the problem.

You should use TOS >= 1.04 when working with harddisks. TOS 1.00 and 1.02
are much slower.

A couple I know run their landscaping and construction business on a Mega ST I sold them a couple of years ago. Recently, they had it upgraded to 4 MB and things worked fine. Several months later, they inherited a Spectre GCR cartridge from another friend whose ST died. Almost immediately, they had problems booting which have gotten progressively worse. The fan in the Mega would turn off and on, the little power-on light in the keyboard would be dim and would flicker. I disconnected all the external disk drives and GCR but the same symptoms persisted. We opened it up and poked around, but nothing was loose. We plugged it in while the case was open and naturally it booted fine. Repeatedly. So we put the case back on and of course it failed again. But not all the time. Now it boots fine about 2/3 of the time. It hasn't failed while running yet (as it did before after being on a few hours).

We called Toad and they suggested the power supply as a likely candidate. The machine is probably at least 5 years old now and has seen almost continuous use for the last year. They use it off and on during the day, so tend to just leave it on (with warp9 screensaver of course). I know leaving systems on is supposed to be generally better for most parts - is the powersupply one of those that dies faster when you leave it on?

Has anyone else seen these symptoms? Did it turn out to be the power supply?

Re Quantum hard disk:

It is very possible you have some fragmentation on your disk. This can slow down read and write access significantly. You might try obtaining a demo copy of Diamond Edge from Oregon Research. For no cost, you can at least determine what level of fragmentation you have on your disk, then determine if it's reasonable to purchase the software.

Moving and copying files wreaks havoc with the hard disks. I have lots of fragmentation on my ST157N but haven't taken the plunge to buying Diamond Edge.

I have some question about this board.... If you don't mind?!

Do the falcon have 32-bit memory accsess??
and
IF so, do the Wing have 32-bit SIMMS on it or just 16-bit???

421. Need help with SCSI Adapter [ICD]

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-21 19:36:56 UTC
From: black@hacktic.nl
Message-ID: <2hpat6INN207@xs4all.hacktic.nl>
Source record: 34800

Greetings, I bought a MEGA 4 STE a while back which has an ICD AdSCSI adapter. The problem is that since the SCSI port isn't terminated, the ICD software to manage the HD won't work mostly since it says I need an ICD host adapter [caused by tthe SCSI not being terminated]. Can anyone either tell me if there is a way to get around this or mail me a diagram of a SCSI terminator that fits on the standard HD port. [This is the problem since I can buy a regular SCSI terminator but that won't fit the HD connector on the ST].

Thankx
&
Peace

I have heard recently that PSpice is available for the ST,
and wondered if anyone knows where it is available. I use it on PC's
at University, and it would be nice to be able to use it on my own ST.

It is PD on the PC, so I therefore think I am not suggesting piracy with
this news article.

Could anyone with any info either email me, or post the group.

Is anybody out there developing GEM/TOS applications in C on a
non-atari unix box with GCC/G++? I'd like to write some C programs
for my ST, but since I don't have a hard drive, a compiler, and only
1meg of memory I'm sort of limited that way. on the other hand, there
are several nice and fast unix machines here on campus.

thanks.. and any recommendations for a good book on GEM/TOS
programming would be helpful, too. I have the atari compendium btw.

You've got bigger problems than a termination pack is gonna fix...
If the ICD host software is telling you that it needs an ICD host
adapter, then it's not SEEING the host adapter you have, meaning that
it may be dead.

426. Looking for base address for IDE registers in Falcon &c.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-22 11:41:49 UTC
From: miff@apanix.apana.org.au
Message-ID: <2hr3dt$plh@olivaw.apanix.apana.org.au>
Source record: 34833

Greetings people!

Having installed a number of the truly excellent Hard & Soft AT-bus/Tos adapter boards in ST's, I am being pressed by several people to design & manufacture a similar device for the STe. (The H&S board fits over the CPU 8( )

Given that the STs is able to take 2.06 directly, there is really only a need to decode the drive's address space, which leads me to a certain problem... I have no idea where the registers are supposed to be - I have checked the Compendium, the falcon developer's notes, and various other sources to no avail. I have not had the opportunity to sit at one of the machines I have upgraded with a logic probe and a memory-seeking tool, and may not be able to for some time, and so I am seeking information from those who should know (of whom several read this group regularly).

I seek no more than the base address for the registers, unless you have other information to impart 8)

If I am successful, I will happily release circuits, board layouts and PAL equations to the net to enable others to duplicate my work.

regards,

Sure it does! I means I was _right_! Atari won't release a new computer by Jan.1/95 (due to the impending doom we all face), so Stephen Jacobs owes me a video game! :-D

Stephen, I'll take "Raiden" for the Jaguar... it'll give me an excuse to buy a Jag.

There were much better followups to that stupid massive cross-post in some of the Sun newsgroups.... ;)

> However, arrow key presses have no apparent effect.
> Does anyone know how to give them their usual function? They worked
> immediately when I installed tcsh on a Unix machine.

This drove me batty for a while, then I stuck this block of stuff in my
mint.cnf before "INIT=u:\bin\tcsh.ttp -l":

```
## Set the keybindings properly... non of these ANSI keycodes for me!
echo Fixing keybindings...
exec g:\mint\bin\xkey.ttp left ^b
exec g:\mint\bin\xkey.ttp LEFT ^a
exec g:\mint\bin\xkey.ttp right ^f
exec g:\mint\bin\xkey.ttp RIGHT ^e
exec g:\mint\bin\xkey.ttp up ^p
exec g:\mint\bin\xkey.ttp UP ^[<
exec g:\mint\bin\xkey.ttp down ^n
exec g:\mint\bin\xkey.ttp DOWN ^[>
```

I'm not sure why or when MiNT started messing my keys up to use ANSI
keycodes... confused the hell outta uEMACS, too.

Now, the only question remaining is... where did I get xkey.ttp?
Unfortunately, I don't remember. It'll be in one of the utility
archives on atari.archive.umich.edu:~/atari/Mint...

>Yes, you can. You'll have to plug terminators into the TT board when you
>have no externally connected drives. The last device on the internal chain
>must have terminators, too.

Since we are talking about terminators: I posted a question months ago
but no-one replied. I've got an internal SCSI drive and an external one.
The external drive's got terminals (powered by the external unit). When
I connect it to my TT, writes to the internal drive occasionally fail.
This has, among other things, resulted in the loss of an entire partition.
So I disconnected my drive, but I think that's a terrible waste for a fast
105 meg unit. Can someone tell me exactly what I should do on the inside
of the TT to get this working?

(BTW. I never had a look on what it looks like on the internal side,
but I was told that at such close distance terminators don't matter.
Obviously if there is a terminator both on the TT and my internal drive,
I would have three of them which could never be right.)

437. HELP: Questions about ADHI...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-22 18:37:10 UTC
From: vij@vnet.ibm.com
Message-ID: <2hrrom$12kh@tornews.torolab.ibm.com>
Source record: 34778
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my
hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

>PS:SORRY FOR MY BAD ENGLISH, I THINK I SHOULD TRY IT MORE OFTEN.

Hmmm... Think of it this way: How much will it cost to get a 486PC with the same
thing as in a FALCON....

16-bit stereo sound IN and OUT, DSP, SCSI-2, IDE, LAN, MIDI, Truecolor graphics.....
And so on...

Bugs and problems are to be found on any computer!!!!

439. UK ST Magazine

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-22 19:55:26 UTC
From: Paul.Civati@mettav.royle.org
Message-ID: <759349814.3@mettav.royle>
Source record: 34831

[Although strictly speaking commercial advertisements aren't allowed
on]
[UseNet I thought I'd post this as it may be of interest to readers...
]

ST APPLICATIONS is a monthly magazine consisting of 60 well-produced
A4
pages which is normally obtained through subscription. Each issue
costs
2.50 UK pounds or 24 UK pounds a year (2 UK pounds each).

The editor is Paul Glover who runs the ST Club, one of the biggest
ST
PD libraries in the UK and well experienced in publishing software
and
books.

ST APPLICATIONS is the ONLY serious, well written magazine for the
Atari
range of computers in this country and well worth the money. All
writers
are freelance and Atari computer owners of some years experience. The
ST,
STE, TT and Falcon are all catered for.

Further details, a sample copy for 2.50 UK pounds and subscription can
be
obtained from:

The ST Club
7 Musters Road
West Bridgford
Nottingham NG2 7PP
England
Tel: +44-602-455250
Fax: +44-602-455305

ST Applications can be bought from Toad Computers in the US who will
take
subscriptions, from Paragon Computers in Australia and ABC in Oslo.

The ST Club also has a distribution agency which has a Canada
office:

Worldwide Magazines
Unit 19
Chelmsley Wood Ind. Est.

Waterloo Avenue
Chelmsley Wood
Birmingham B37 8QD
England
UK Tel: +44-21-788-3112 Canada Tel: +1-519-539-0200
UK Fax: +44-21-788-1272 Canada Fax: +1-519-539-9725

SUBSCRIPTION RATES:
UK 12 issues - 24 UK pounds (plus 6 Disk Mags - 36 UK
pounds)
Air Mail Europe - 27 UK pounds (plus 6 Disk Mags - 40 UK
pounds)
Air Mail World - 37 UK pounds (plus 6 Disk Mags - 48 UK
pounds)

Subscribers get discounts on ST Club software, accessories and hardware
and
20% off PD and Shareware disks (1 UK pound each).

A Disk Magazine is also offered which contains a compilation of the
latest
PD software. It is bi-monthly and not a magazine.

Cheques and postal orders (crossed) drawn on UK banks should be made out
to
SIMPLE LOGIC and CO. (Overseas customers please ask for ways to pay),
sorry
no credit card facilities at present but may be due soon.

Back Issues cost 2 UK pounds each, 1.25 UK pounds each for 3 or more
issues.
Issues 1 to 12 - 9.95 UK pounds, 13 to 24 - 9.95 UK pounds.

Also a 3-issue trial subscription is available for 3 UK pounds.

GUARANTEE:
If at any time you wish to cancel a subscription, just write and the
unused
portion of your subscription will be refunded by return of post.

This is not the case, cause when I bought the STE the guy I bought it from
hooked up an external SCSI drive and then the ICD s/w performed perfectly.

Any other ideas?

> [...]
> Does anyone have a solution or at least more information?

Set your port speed as high as you can. The 14400 limit is between the
two modems, not from your modem to your computer. With data compression,
even though the bit stream between modems maxes out at 14400, data can
come out of the modem at up to 57600 (given 4:1 ideal compression, which
never happens). Thus, for any data compressing modem (all >=9600 baud
modems are such) you should set your port speed to much higher than the
actual baud rate of the modem. Given v.32/v.42bis, for a 14400, 57600 is the
potential max baud rate. For a 9600, 38400 is the potential max.

If you don't do this, you will get not benefit from the data compression
protocols. This might also be the reason for your problems with the FAX
programs. Hope this helps.

Uh, did that external drive happen to have an ICD host adaptor in it? I
do not have a MegaSTE (yet), but my understanding is that no SCSI termination
is needed to get the ICD host adaptors to work. Thus, I would have to
agree that your ICD board might not be working correctly. Hope this helps.

443. Moniterm Monitors (Help!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-23 00:35:35 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CK24BB.Fvl@watserv2.uwaterloo.ca>

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I found a surplus store today that had Moniterm VY1000 19" mono monitors
for $100. They have a 9 pin "joystick" connector on the back and come
with some manuals, etc. They say a UNIX driver is needed.

IS this the same monitor they sold for the ST? Is there any other hardware
needed for the ST to drive it or is the software driver all that is necessary.
They have 3 monitors so I would like to hear from people if they know
anything about this - I could probably send someone else a monitor if they
really wanted one. Any help would be greatly appreciated - $100 would
be a real bargain for a 19" monitor.

Thanks,

The Viking Moniterm 19" monitors for Mega series computers required a board
that plugged into the expansion bus present only on Mega's (this was before
the STe, MegaSTe, TT, Falcon, so I'm not sure about those). Thus, if you have
a MegaST you would need to procure an addition board at the very least.

Incidentally, they sound like old Sun2 or Sun 3/50-60 monitors. There has
been discussion in the past of hooking such monitors to STs, but I don't
remember any positive experiences being related.

I had virtually the same problem, when I installed a harddrive into my
Mega2 using the space provided in the original case.
The drive got pretty hot, as the powersupply fan was not up to the job
of also cooling a hd. So the MMU which was just a few millimeters below
the drive got hot,too.

After a few days the bombing and rebooting problem occured, until I
pressed onto the MMU chip. (Got pretty scared, since a chip that has
holding clamp on top of it needs a lot of heat to "walk", and maybe not
much more to melt.So I moved to a PC case with space and a big fan)

Anyway, long talk short message, if your MMU is socketed and has no
clamp (apparently there are a few around), then it could also be
"walking" due to heat or movement during your installation.
(Even with a clamp it's worth checking)

Yes, probably. I had the same problems with my Mega ST some weeks ago.
It turned out to be the plug connecting the power supply to the mainboard.
It had a fairly weak contact, so I cleaned it and everything was ok.

Your routine has to return all those bits of ob_state that your code
did not handle. Unfortunately 3D effects are coded in ob_flags, thus
you cannot return, whether you want them to be applied or not. In this
case MTOS always assumes that it has to handle 3D effects! Moreover
current versions of MTOS seems to be buggy in determining wether they
have to draw an "activator" or an "indicator". Actually, redraw
behaviour of selected 3D objects changes arbitrarly. Thus I would
recommend for any userdef'd object to handle 3D effects in the
object's redraw code *and* clear any 3D flags in ob_flags! Another
point to watch out for comes into play when you draw your dialog box
in a window. Objc_draw will only redraw those objects that intersect
with the current clipping rectangle; this code is bound to cause
redraw failures when you have (userdef'd) 3D objects that extend
beyond their natural boundaries! Thus I would recommend to extend
userdef'd objects to the maximum size that they might possibly occupy
and adjust the redraw code to only draw within these boundaries!

Happy hacking,

Markus

>meaning
>of this return code.

Ah. The return code of a G_USERDEF drawing routine is an ob_state bitmap
of unprocessed states. The AES then processes the state by itself.

Example: Code for nicer separation lines in menus:

static WORD cdecl usr_menuline( register PARMBLK *pb )
{
WORD xy[4];

clip( pb );

xy[0]=pb->pb_x;
xy[1]=pb->pb_y+(pb->pb_h-1)/2;
xy[2]=pb->pb_x+pb->pb_w-1;
xy[3]=xy[1];

vswr_mode( vdi_handle, MD_REPLACE );
linemode( 1, FALSE ); /* aux function, does vsl_xxx() settings
*/

v_pline( vdi_handle, 2, xy );

return DISABLED;
}

This code just draws a horizontal line centered to the object's half
height. The "return DISABLED" bit makes AES draw a white pattern over it,
just like with standard disabled objects.

This will work for SELECTED and DISABLED, other ob_states are better
processed within your own code - the AES standard behaviour might look
```

strange on non-standard objects.

>i understand it to apply some state modifications, with d0 being the bit
>flags. i do not know how it would deal with 3D objects for instance. i
>have not seen the Compendium, so what are the discrepancies?

Objects that have 3D bits set will have their 3D borders drawn by AES
before your drawing code is invoked.

bye, Peter

This seems fairly reasonable of MTOS. But of course you are right that it would be bettter in ob_state. Who knows why it was not put there?

>current versions of MTOS seems to be buggy in determining wether they
>have to draw an "activator" or an "indicator". Actually, redraw

Really? i've never seen this occur. Current version seems pretty good in most respects.

Good man, but that's the case even without 3D effects. The current ad3d size of two pixels is nothing when you consider shaddowed/bordered/exit objects for instance. IMHO it is contrary to the way GEM works to have any drawing going on outside the object boundary. i mean, in addition to what you have said, it is quite bizarre to draw but not find a graphic.

>userdef'd objects to the maximum size that they might possibly occupy
>and adjust the redraw code to only draw within these boundaries!

Hmm, not entirely sure what you mean here. What are 'these' boundaries ?

Adam.

I believe you'll have to carry out a software disable of the parity checking on the ELS drive, since I think it doesn't have a jumper to disable parity. It could be though that if you have the right ICD host adapter it may be able to handle the parity checking.

With any luck someone more knowledgable will respond to your query. If you're still stuck, mail me and I can email a file to you with some more info.

Good luck,
John

>far, everyone I ask say it's not.

I believe the board in question is called the Ram Gizmo. It was developed by a guy in the fidonet named Gizmo (Chris someone.) There was a bit of talk about it last year, Gizmo actually told a bit about it, but whether or not he still reads this newsgroup or not is another story. I believe the Gizmo retailed for about $90 US, and took 8 or 9 bit? simms.

If there is anyone who is interested in more info, I'll got through my stuff at home and post the info I captured long ago ...

Karl.

458. MultiTOS Gemini 1.99 console interaction problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-24 07:50:15 UTC
From: tvoverbe@estwk5.estec.esa.nl
Message-ID: <CK4J3s.46K@wm.estec.esa.nl>
Source record: 34834
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

When trying out Gemini 1.99 together with MultiTOS 1.0 (Mint 1.04 + AES 4.0)
on my TT I noticed the following problem.
When running a TOS/TTP program in the console window both Gemini and the TOS/TTP
program are competing for keyboard input. Very annoying when running something
like more and you have to hit the space bar a number of times till the next
page appears. After exiting more you then get all the 'missed' spaces echoed.
I suppose this is a generic problem when running any TOS/TTP program in
Gemini's console window.
Has anybody else noticed this ? Any explanation and/or fixes or workarounds
known ? Does any of our German friends have some more info from the
Gemini MAUS group ?

AFAIK you can pass multiple parameters to xkey:

exec g:\mint\bin\xkey.ttp left ^b LEFT ^a right ^f RIGHT ^e

The Sozobon compiler can be built to be a cross compiler under unix. It certainly compiles under unix if you set the right flags, but I don't know how well the code runs. Also the stdio library has a serious memory leak.

|> thanks.. and any recommendations for a good book on GEM/TOS
|> programming would be helpful, too. I have the atari compendium btw.

The Compute series by Sheldon are quite useful if you can get them. Also the "Pro GEM Programming" series of articles ftpable from atari archive are good. The DataBecker GEM book should definitely be avoided.

: Do the falcon have 32-bit memory accsess??
: and
: IF so, do the Wing have 32-bit SIMMS on it or just 16-bit???
:

To keep prices down most SIMM add-on board for the Falcon will take 8 bit or 9bit SIMMs. You upgrade the memory by placing 4 SIMMs in at a time thus allowing full 32 bit access to the memory. Each SIMM acts as 1 quarter of the full 32 bit piece of data being read. This way is used as it is standard in PC and so will be cheaper to upgrade with due to the enormity of the PC market.

I've never had any problems with my Eagle 32 board, and Calamus just flies along. Quite useable now.

Gemini's console windows isn't (yet) adapted for MTOS, so you'll
have to live with these effects (for now).

Sozobon runs just fine on a 1meg system. It was developed on a 1meg system with no hard disk and a 1/2 meg ram disk. This is probably a lot easier than cross compiles and downloads for testing...

Also, what is the 'stdio memory leak'? Lets fix it!

Uploaded to ftp.uni-muenster.de: progtl01.tos (pub/atari/Utilities, selfextracting ZIP file).

The archive contains some tools for programmers:

cc, c89: POSIX compliant frontends for Pure C
ident: shows RCS id's
nm: display symbols from object files or libraries (DR, Pure, GNU)
rsccrc: calculates CRCs of RSC files suitable for runtime check after rsrc_load
rcssplit: splits RSC header files for each object tree
size: display segment sizes for binaries and object files (DR, CPX, Pure, GNU)
strip: strip symbol tables from executables and CPXs.

Documentation is in German, the programs use German or English depending on the setting of $LANG.

Greetings, I hope someone can help me with this:

I have an Atari 520STFM, quite a late one with surface mount MMU chip
etc, and Frontier/Marpet XtraRam Deluxe with 2 mbyte installed.

This machine has been working perfectly for 3 years know, I had
the PSU replaced under warranty (wish I hadn't, but thats another
story) and use the MIDI ports extensively, and the serial port
occasionally. I have been running with a TV as the monitor.

I decided to take the plunge and go hi-res. I purchased a SVGA
Mono monitor with Atari adaptor from Ladbroke computing. I could
not get this monitor to work with my ST. The speaker on the ST adaptor
emitted a constant frequency (and quite loud, not just pickup) tone
when enabled. The monitor did not synch properly, nothing resembling a
desktop appeared. I tried booting in several different ways including without
a disk present. The system booted but no desktop (I know it booted cause
it stopped accessing the drive). I tried plugging the TV in while booting
with the monitor connected and there WAS a desktop on the TV screen but it
wouldn't synch and it was all screwed up (menus/icons in wrong place,
only a small portion of the screen visible).

I suspected a problem with ST adaptor. Ie line-out connected to
a synch line. Ladbroke suggested
trying the monitor with another ST. I did this. My friends "vanilla"
520STFM produced EXACTLY the same symptoms.

I shipped the monitor back to Ladbroke as doa. Today they have finally
got round to testing it and claim it works PERFECTLY on a 1040 STF they
have. Also, they claim there is no constant tone from the ST adaptor. We
quickly discounted the theory that the adaptor was damaged in transit and
miraculously cured by the journey back to Ladbroke. Their engineer suggested
some tolerance problem.

I am going to try my ST with a friends SM124 tonite. I THINK I did this
a few years ago and it worked. Its possible the Mono output has become
broken in the meantime I guess. But then my friends STFM gave the same
symptoms.

So, I have the following questions for all you Atari experts out there
on Usenet.

(1) Has anyone else experienced problems connecting a hi-res monitor
to an 520STFM, or any other Atari? I believe mine to be quite a late
model, surface mount MMU, soldered in shifter etc. It was part of a
Discovery pack (ie sold
as a games machine).

(2) Has anyone ever experienced the sort of symtoms I describe with a
any hi res monitor? If so how did you fix it.

I'd appreciate replies by e-mail as I have to decide what to do asap.
Ladbroke have been quite reasonable and offered to either have a look
at my ST or let me have an SM124 that they use for testing instead.
I'd prefer to have a more future-proof SVGA than a used SM124, and I'm
also reluctant to let others inside my machine and to loose it for several
days/weeks.

Thanks a lot in advance for any information.

(and I wish I'd just brought it into the lab and got the guys here
to help me sort it out, but it was a NEW monitor. As a colleague said,
"did they get it right first time?".

DO NOT PUT A TERMINATOR ON THE DMA PORT OF YOUR MegaSTe!!!

(Unless you want to totally disable your system)

With that imporant message out of the way...

All but 1 AdSCSI interface I am aware of are external to the system. The
AdSCSI-Micro was/is internal for the original Mega ST, I have not heard
of it working inside the Mega_STe.

So from here on I'll assume you have an external HD. First the really
silly question: is the cable from the computer's DMA port going to the
ACSI-In port on the AdSCSI? If it is on the ACSI-Out port you are lucky
to get your system to boot. (I spent two days looking for this problem
once) Next are you sure there is power to the AdSCSI board?

Even if you do not have any drive hooked up to the AdSCSI the software
should see it there. It will report no hard drives found. If your HD
is inside your MegaSTe it is most likely an Atari adapter and if ICD's
software can not find an AdSCSI host adapter most of their utilities
will refuse to run, unless you have/buy the ICD AdSCSI-Pro software for
Mega-STe's, TT's and Falcons.

If you want more info please email me.

Brian

I think, the way GEM that you have to code 3D effects has been changed from ob_state to ob_flags in order to circumvent conflicts with existing GEM libraries that would use extended ob_states. I am not entirely positive, but I think I remember that TOS 4.01 still uses ob_states.

>
> >current versions of MTOS seems to be buggy in determining wether they

Sorry, my fault. These errors do not occur for regular objects, but only for userdef'd ones; thus you are not very likely to notice them. Off hand, I cannot think of any library (other than the one that I am currently writing) which applies 3D effects to userdef'd objects --- but then, I might certainly have failed to notice recent developments...

>
> >behaviour of selected 3D objects changes arbitrarly. Thus I would

> instance.

I think, GEM is partly able to cope with these effects; I am not sure about userdef'd objects, but anyways GEM will correctly handle regular objects that extend beyond their natural boundaries (the ones given in ob_x, ob_y, ob_width,

ob_height).

> IMHO it is contrary to the way GEM works to have any drawing going on
> outside the object boundary. i mean, in addition to what you have said, it is
> quite bizarre to draw but not find a graphic.

I share your view towards the notion of (not) extending objects beyond their natural boundaries. But GEM does this for regular objects and thus you just have to live with it; although I fear, GEM's approach towards handling object sizes causes more problems than your approach would do :-(

>
> >userdef'd objects to the maximum size that they might possibly occupy
> >and adjust the redraw code to only draw within these boundaries!
>
> Hmm, not entirely sure what you mean here. What are 'these' boundaries ?

OK, I will try to rephrase that sentence :-) What you need to do after loading a resource file is: 1) find all objects that need conversion to userdef'd objects, 2) change the object type and set ob_spec appropriately 3) check whether this object is supposed to have attributes such as 3D effects 4) if this is the case remove the 3D bits in ob_flags and 5) extend the object dimension (ob_x, ob_y, ob_width, ob_height) by the extra space needed for these effects; 6) use ub_code that knows about 3D effects and draws only within the the area given by parmblk->pb_x, parmblk->pb_y, parmblk->pb_width and parmblk->pb_height.

Extending the size of an object might require you to also change the size/position of parent/child objects! It is possible to write an iterative algorithm for this task --- if you want to, I can send you a copy of the routine.

472. GFA Programming Help

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-24 15:48:27 UTC
From: grillo@olivea.ATC.Olivetti.Com
Message-ID: <2i0qkb$dui@olivea.ATC.Olivetti.Com>
Source record: 34746

Hi there,

I need some help from you net-gfa-programmer-guru:

I need to run a TOS (ttp) prohram from GFA-Basic and redirect the output of
the program in a certain area of the screen , such as a window of the program
from where I launched the ttp.

Is it possible ? and How ?

Since I have the source of the ttp program can I compile the gfa-prog and the
C module and call the module as a procedure from the gfa prog ?

Thanks in advance!!

Savino

|> Also, what is the 'stdio memory leak'? Lets fix it!

As far as I can remember, it goes like this:

fopen() checks to see if there is already a buffer for the file handle it is about to allocate and if not malloc()'s one.
fclose() does not free() the buffer but does set the buffer pointer to zero, losing track of the memory and causing fopen() to malloc() a new buffer next time around.
Thus if you open and close enough files you eventually run out of memory.

This bug existed at least up to the point where HSC spun off from Sozobon C because it bit me under HSC 1.40 as well as an old version of Sozobon (my sequencer grabs all but 8K of RAM for itself so the memory leak kills it relatively quickly if not painlessly :-(). It's easy to fix though - I just commented out the offending line from fclose() & recompiled.

BTW where is Ian Lepore these days? - I've not seen him post for months.
And whatever happened to HSC 2.0 ?

Steven

474. Re: Mega ST Powersupply problem?

Atari power supplies are notorious for failing, esp under under unusual loads. Example: I upgraded my 520STFM using DIPS to 1 meg of RAM. Shortly after, the power supply failed.

I called Best Electronics (and I don't have the number with me unfortunately) and they set me up with a new higher output supply.

They can do the same with a Mega. I also bought the upgrade power supply for my Mega STe. So far, the Atari supply hasn't failed, but it has shown signs of weakness.

I would definately take a DMM and check your voltages on the motherboard. You should have a full 5V coming from the power supply. You might also, if you have one handy, take an oscilloscope (nothing fancy, an analog will work) and see if there's any ripple on the 5V line. This will give you some indication of what condition the power supply is in.

OK, a few more MegaSTE questions (mine is in the mail!!!).

First, thanks to all that have responded to my previous MegaSTE questions, and in advance to responders to this post. I have a lot to catch up on WRT this model of machine, as it has been around for about 3 years or so (I am reminded of the guy that found out about Fatspeed just a few weeks ago, after using a s-l-o-w ST hard disk for a long time). As I find out about MegaSTE quirks and hacks, I intend to record them in a FAQ of sorts. So, if you have any comments about MegaSTE's that you think might be of use to an experienced ST'er but totally bumbling STE'er please feel free to email or post them. Also, any additional comments about the MegaSTE 16mHz capability (recommendations of auto folder programs to control this feature, programs that don't like it, etc.) would be appreciated.

So, here are the questions:

1. Opinions on the AT-Speed 286 emulator for the MegaSTE: Is it robust, is it worth keeping, how much do they cost? Do they come with a math coprocessor standard? How much does one cost (ballpark figure)?

2. Speaking of coprocessors, it is claimed that the machine I bought has one (independent of the one on the 286 emulation board). I presume this would be a 68881. Must an application be compiled to use the coprocessor for any benifit to be obtained? Can it screw any software up by being there? How much does one cost (ballpark figure)?

2. What is the DB-9 jack on the VME bus cover?

3. Mine has TOS 2.06. Is there any better that can be installed without additional boards/weird hacks? Any bugs I should worry about? Any "must have" patch programs?

4. It has a 48mb internal hard drive (which I intend to replace with a bigger unit). Is the Atari host adaptor built into the motherboard? If not, can it easily be replaced with an ICD AdSCSI Micro?

5. What is a Discovery cartridge? As I now own one, I thought it would be good to know :-).

6. Now that I have an STE, I can look at all those excellent demos that would not work on my ST. Unfortunately, I did not have the foresight to write down the names of those I discovered to require STE hardware. What are your favorites (I already know about the Omega demo, as it was about 50% of my motivation to purchase an STE machine)?

7. What are some nifty things I could stick in that VME slot? Graphics boards? Ethernet (highly desired)? Is it equivalent to the internal

bus connector present in MegaST's, or is it totally different? If different,
does the MegaSTE have an internal bus connector as well?

}
}The Viking Moniterm 19" monitors for Mega series computers required a board
}that plugged into the expansion bus present only on Mega's (this was before
}the STe, MegaSTe, TT, Falcon, so I'm not sure about those). Thus, if you have
}a MegaST you would need to procure an addition board at the very least.
}
}Incidentally, they sound like old Sun2 or Sun 3/50-60 monitors. There has
}been discussion in the past of hooking such monitors to STs, but I don't
}remember any positive experiences being related.
}

OK, I know it's a TT, not an ST, but...

a few months ago, we modified a Sigma Designs L-View 19" monitor to work
with my TT. It wasn't much more than making a cable to go from the 15 pin
VGA jack to the 9 pin monitor jack. Also had to make a little circuit to
invert either the horizontal or vertical sync (can't remember). And then
adjusting the horizontal sync inside the machine to match the TT.

It works great and it was free to boot. Barely use the other monitor these
days, I don't think it's been plugged in since maybe November..

You need not search for xkey. Tcsh has a built-in command for binding
keys. See the tcsh docs for details. I believe I have something like

bindkey "^[[A" up-history (maybe only one "[", I don't remember)
bindkey "^[[B" down-history
bindkey "^[[C" forward-char
bindkey "^[[D" backward-char

in my tcsh.rc file. You can also type these commands from the command
line.

478. HELP: Questions about ADHI...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-24 17:36:16 UTC
From: vij@vnet.ibm.com
Message-ID: <2i10ug$fer@tornews.torolab.ibm.com>
Source record: 34789
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my
hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

479. Mega STe Coprocessor and Spectre

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-24 17:58:57 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CK5BA9.MCn@watserv2.uwaterloo.ca>
Source record: 34755
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a Mega STe without a coprocessor and I have a Spectre 3.0:

1. Will both the 68881 or 68882 work (are they pin compatible?)
2. What package type is the Mega STe socketed for?
3. The Spectre manual says it will recognize the coprocessor in
a TT but doesn't mention the Mega STe (it probably wasn't out
when the 3.0 Spectre was released). Has anyone with a Mega
STe and coprocessor confirmed it works?

How much should I pay for a coprocessor? Every place I called in
Toronto does not have 68881 anymore - they say they're being phased
out. A 68882 costs $122. Is this reasonable?

Thanks,

>a quick look.
>

Hi Steve,

as far as I know there is only one ST-RIP-Terminal available.

I quote from the english documentation (YES!):

>>> STrip <<<

Copyright (c) 1993 by Lars Kupferschlï¿½ger

The first terminal program for the
Atari ST series of computers that
supports the Remote-Imaging-Protocol (RIP)
...
1 What's STrip?

STrip is the first terminal program for the Atari ST which
supports the Remote-Imaging-Protocol (RIP).

RIP has been developed by TeleGraphics, a USA Company and is a
7-bit ASCII transfer protocol for color graphics, mouse control
and more.

RIP requires a graphics resolution of 640 * 350 pixels in 16
colors, which is provided by an IBM compatible PC with EGA
compatible graphics card.

The monochrome mode of the Atari ST offers an appropriate
resolution(640 * 400 pixels min.) but only two colors, namely
black and white.

This means that a 100% implementation of RIP isn't possible on
the ST because the necessary hardware requirements are not

available.

From the software developer's point of view, this lack is the special challenge of implementing RIP on the ST: To represent RIP codes as good as possible on a black-and-white plane.

Those who have dealt with this problems a little bit closer will have recognized that this isn't an easy task and should not be underestimated.

With "STrip" I have developed an application which achieves very good results on this matter. But because of the technical reasons cited above it can't come up to the standard of a real color implementation.

To date, this version of STrip v0.95 supports appr. 90% of all RIP functions.

Of course, STrip will be expanded further and adapted to the developing standard.
...
2 Hardware requirements

STrip has been designed for the monochrome resolution of the Atari ST (640*400 pixels).

A higher monochrome resolution could not be tested but should be possible.

Color graphics cards or the two color modes of the Atari ST are currently not supported.
...

Newsgroups: comp.sys.atari.st
Subject: Speedo w/SLM804 and MSTE
Summary: won't work?
Keywords: Speedo, SLM804
Organization: Faculty of Engineering, Memorial University of Newfoundland

I have Speedo, but can't get anything to print on my SLM804. If you
bring up the devices (or printers?) acc, is says printer for the
port to use. It should be DMA, but this option is not selectable.
This can't be an oversight by Atari, can it?

Any body have any ideas? I have tried to print with both Works, and
STraightFAX 2.0, both Speedo prgs. neither will print.

I have never been able to get LaTeX to print with the SLM804 either...
I'm going to have another try at that soon, though...

thanks

482. ST Hi Res Monitor /520STFM compatibility problems.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-24 18:57:15 UTC
From: tjl@siva.bris.ac.uk
Message-ID: <CK5DzF.88@info.bris.ac.uk>
Source record: 34757
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Greetings, I hope someone can help me with this:

I have an Atari 520STFM, quite a late one with surface mount MMU chip
etc, and Frontier/Marpet XtraRam Deluxe with 2 mbyte installed.

This machine has been working perfectly for 3 years know, I had
the PSU replaced under warranty (wish I hadn't, but thats another
story) and use the MIDI ports extensively, and the serial port
occasionally. I have been running with a TV as the monitor.

I decided to take the plunge and go hi-res. I purchased a SVGA
Mono monitor with Atari adaptor from Ladbroke computing. I could
not get this monitor to work with my ST. The speaker on the ST adaptor
emitted a constant frequency (and quite loud, not just pickup) tone
when enabled. The monitor did not synch properly, nothing resembling a
desktop appeared. I tried booting in several different ways including without
a disk present. The system booted but no desktop (I know it booted cause
it stopped accessing the drive). I tried plugging the TV in while booting
with the monitor connected and there WAS a desktop on the TV screen but it
wouldn't synch and it was all screwed up (menus/icons in wrong place,
only a small portion of the screen visible).

I suspected a problem with ST adaptor. Ie line-out connected to
a synch line. Ladbroke suggested
trying the monitor with another ST. I did this. My friends "vanilla"
520STFM produced EXACTLY the same symptoms.

I shipped the monitor back to Ladbroke as doa. Today they have finally
got round to testing it and claim it works PERFECTLY on a 1040 STF they
have. Also, they claim there is no constant tone from the ST adaptor. We
quickly discounted the theory that the adaptor was damaged in transit and
miraculously cured by the journey back to Ladbroke. Their engineer suggested
some tolerance problem.

I am going to try my ST with a friends SM124 tonite. I THINK I did this
a few years ago and it worked. Its possible the Mono output has become
broken in the meantime I guess. But then my friends STFM gave the same
symptoms.

So, I have the following questions for all you Atari experts out there
on Usenet.

(1) Has anyone else experienced problems connecting a hi-res monitor
to an 520STFM, or any other Atari? I believe mine to be quite a late
model, surface mount MMU, soldered in shifter etc. It was part of a
Discovery pack (ie sold

as a games machine).

(2) Has anyone ever experienced the sort of symtoms I describe with a
any hi res monitor? If so how did you fix it.

I'd appreciate replies by e-mail as I have to decide what to do asap.
Ladbroke have been quite reasonable and offered to either have a look
at my ST or let me have an SM124 that they use for testing instead.
I'd prefer to have a more future-proof SVGA than a used SM124, and I'm
also reluctant to let others inside my machine and to loose it for several
days/weeks.

Thanks a lot in advance for any information.

(and I wish I'd just brought it into the lab and got the guys here
to help me sort it out, but it was a NEW monitor. As a colleague said,
"did they get it right first time?".

>>Also, what is the 'stdio memory leak'? Lets fix it!

>Ah, but I bet there is no memory leak if you use the mintlibs is there?

Not as far as I know [knock on wood ;)]. A 'stdio memory leak' does sound like a bug in dLibs rather than the compiler proper. I know of a few bugs in dLibs, but I hadn't heard of this one.

On the cross-compiling issue: I'm not sure how different HSC 1.40 is from Sozobon 2.0 (which I presume is what you're using), but it's quite possible that you can use the MiNTlibs as a drop-in replacement for dLibs. If not, you should be able to build it from the sources without problem.

>> Johann Ruegg
>> Sozobon Ltd.

>What? There is a company with the name sozobon?

Sozobon Ltd. is, I believe, the name of the group that made the Sozobon compiler in the first place.

```

The Sozobon compiler can be used even on an st with a single floppy and 1MB RAM (although this will be slow and floppy switching is a pain.) You'll need a comman line shell. For such a small system i'd recommend gulam because it has all the necessary functionality builtin and is fast.

That's disappointing because ob_states should've been off-limits to everyone
but Atari. But then i am not taking commercial considerations into account.

>> Good man, but that's the case even without 3D effects. The current ad3d size of

>ob_height).

'partly' might be the keyword. Actually you contradict yourself, but no matter,
we both know there is a problem. There is no way GEM could cope with these
effects if they become severe. i have not checked your assertion, and i doubt
that GEM does anything more than perhaps add a few pixel fudge factor before
rejecting a subtree. If at all! This should show up with fine scrolling, so it
is not completely trivial. And it would also occur if children, aligned at a
parent's origin ([0,0] relative) had the external effects but the parent did
not. No way is GEM looking though the entire tree, it would completely lose all
the benefits.

>I share your view towards the notion of (not) extending objects beyond their natural
>boundaries. But GEM does this for regular objects and thus you just have to live
>with it; although I fear, GEM's approach towards handling object sizes causes more
>problems than your approach would do :-(

Maybe not... Something i do after a rsrc_load() is to check all the trees for
various objects and adapt them for various reasons. e.g right justified editable
objects are buggy in early AES so i change to progdefs, and all the other things
you want to do. But your next point suggests it could be taken a step further.

>> Hmm, not entirely sure what you mean here. What are 'these' boundaries ?

Yes please do. i am tempted at times to rewrite the objc_draw funtion. i have
mounted up at least a dozen reasons for doing so. It is not a difficult task,
just a time consuming one. The VDI does all the hard work. The main reason for
me not doing so is that it would require a resource editor too.

488. Re: WINX

It was none other than Paul Tuijnman that wrote on the 16 Jan 94 that ,
PT> How do I get WINX to produce the 40 promised windows? I have a Mega4
PT> + SM194 19" screen and some extra windows could come in handy..
PT> (btw: I have tried all the options int the config file)

Upgrade to TOS 2 I/m afraid , AFAIK with early TOS you don't get the extra window's ,just some of the other features ,IE you can at least set the Window Colours. BTW even with Fully Compatible TOS's you cannot get 40 Window's at the desk (8 only) it is only from application's (and only those that are correctly programmed) that will support the 40 windows. Some program's will not allow more than there own limit .... LED is a good example of that.

The extra window's is available as default BTW.

Quatum ELS Hard Drives...

These drives have software Parity, you will need to get ICD's program ELS.LZH
to disable the Parity of these drives, but you will need a host adapter
or computer that allows Parity to start with...

So you cold be stuck, also older versions of these drives can't be changed,
the Rom version of these Quatum drives is mentioned in this file..

I'm trying to write QADSTFAX - Quick And Dirty ST FAX -.

It should use Haeyes-Code and only consist of send and receive.

I believe there are enough converters from and to other formats than FAX G3.

If there is interest, I will post, if I've got a beta-release.

Any help from FAX-Experts are welcome.

I have a CREATIX-Modem (DATEX-J)

Sozobon 2.0 addes support for long names to the assembler and linker.
You would want a long name version of any libraries. There was
a tool to lengthen names.

P.S. Sozobon Ltd was a real company, but we had to disband due to
paperwork requirements and taxes. Colorado wanted a $50 sales tax
deposit and quarterly reports even though we only ever sold one
$10 copy in Colorado. The last straw was the county telling us
we had to pay taxes on all 3 partner's computers and home office
furnishings even if only 5% of our time was spent on Sozobon.

494. help needed to install custom trap using GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-25 10:12:42 UTC
From: censjg@caledonia.hw.ac.uk
Message-ID: <1994Jan25.101242.20467@cee.hw.ac.uk>
Source record: 34770
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all,

I want to be able to install custom traps/exception
handlers from a C program.

A quick look at an assembler book suggests I should be able to do
something like:

```
lea _exception_vector, a0
les _exception_handler_func, a1
move.l al, (a0)
```

in supervisor mode. So, trying to be smart (read naive), I thought I'd
attempt this from C with something like:

```
8<-----------------------------------------------------------------

#include <stdio.h>

int trapAddr = 0xA8;
void trapFunc(void);

void
main(void)
{
static long install_handler(void);

Supexec(install_handler);

getchar();

asm("trap #10");
}

static long
install_handler(void)
{
asm("lea _trapAddr, a0");
asm("lea _trapFunc, a1");
asm("move.l a1, (a0)");

return 0L;
}

void
trapFunc(void)
{
printf("\n\n*****\tBoo!\t*****\n\n");
```

```
getchar();
}
```

8<----------

This compiles ok (gcc-2.5.7, gas-2.2), and seems to install ok, but I get a full screen width line of bombs when it calls the trap. I know it should probably do an rte back from the trap, however it doesn't get as far as printing the message. I tried putting printf's in to see what the program was putting into the exception vector address, and I think it's ok, but still doesn't work. Should I be concerned about relocation (didn't think I should...), any other suggestions (apart from 'learn C':)?

(Should have said I'm actually cross compiling on a Sun3)

email preferred.

TKR's Tele Office can do it, too. But it's commercial.

> STe and coprocessor confirmed it works?
My MSTE has a 68881. It (the 68881) is not recognized by Mac programs running under Spectre 3.0. Presumably that's because the 68881 doesn't really function as a coprocessor with the 68000 in the MSTE, as it would with the 68030 in the TT. With the 68000 the floating point chip behaves like a _peripheral_, using the Atari SFP004 board (I may have the name of the board slightly wrong).

And which of those will be useless features for him?

How much will it cost to get support for a Falcon? How much will it
cost to get enough RAM for MultiTOS to be useful (ie, "14" megs, since
the Falcon doesn't support 8M or 12M of RAM, and 4M doesn't leave a hell
of a lot for applications)? _Where_ will he get software?

There is a socket located in the front/left of the card. Just plug the FPU
in it, as understood...
Applications must be compiled specifically to use the FPU (one solution to
this problem would have been implementing efficient math functions IN the
operating system, that may USE the FPU if present, but unfortunately it think
it is too late for this :-( ).
I don't know exactly how much is costs.

>2. What is the DB-9 jack on the VME bus cover?

It's a 3rd full (and FAST !) RS 232. It's the equivalent for the LAN port
on the left side (it IS the same port, in fact) => you can use either one
or the other.

>
>3. Mine has TOS 2.06. Is there any better that can be installed without
>additional boards/weird hacks? Any bugs I should worry about? Any "must

There is no better TOS currently... You can download several patches on various
FTP sites, that overcome some little bugs.

>
>4. It has a 48mb internal hard drive (which I intend to replace with a
>bigger unit). Is the Atari host adaptor built into the motherboard? If
>not, can it easily be replaced with an ICD AdSCSI Micro?

No, it's a little card plugged into a special socket (just under the hard-disk
itself -> easy to reach. As the AdSCSI Micro is intented to be plugged in the
Mega ST 68000 Direct Bus socket (as far as I remember), I don't know whether
it is possible to do this manipuation.

Why not keep your internal HD AND adapter, and buy both an external drive AND
ICD adapter ? That's what I did, and it works FINE for me.

```

You are *not* setting the vector for trap #10, but rather
storing the address of trapFunc into the variable trapAddr, as if you
have written

```
trapAddr = (int) trapFunc;
```

(assuming 32 bit int's). You can use Setexc() to set exception
vectors (don't forget to #include <osbind.h>):

```
Setexc(0xA8, trapFunc).
```

> How much will it cost to get support for a Falcon? How much will it
Where do you get support for a PC ?
Most dealers just sell you your PC and then it's your problem - and a PC
IS always a problem.
> cost to get enough RAM for MultiTOS to be useful (ie, "14" megs, since
> the Falcon doesn't support 8M or 12M of RAM, and 4M doesn't leave a hell
> of a lot for applications)? _Where_ will he get software?

It's no problem to get software for the Falcon in Germany - just a phone call away.
OK. The RAM is a problem, but there discussing about a 8 MB card here,
maybe it will be awayable soon. Or you take it all and get the 16 MB card, that'll be
enough for some years...

503. Resetting IKBD on Falcon/in general?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-25 15:12:58 UTC
From: saj@chinet.chinet.com
Message-ID: <CK6y9M.9J4@chinet.chinet.com>
Source record: 34781

I'm poking at an application which ideally ought to give the user the option of doing all sorts of funny things to the IKBD device. Consequently, as part of the cleanup on termination, it ought to reset the device to startup settings. Ikbdws() sending 0x80,0x01 is documented to do this, but it seems to be a fairly efficient way of causing console freeze-ups, phantom typists and general agony. Is there a safe way to do this (I'm hoping for advice on things like time delays, checking key states, clearing buffers, those sorts...)? I'm particularly interested in the Falcon030. Having had a peek at the Ikbdws() code in ROM, it appears that a lot has changed since the 1040ST. I don't find documentation on this in my paper hoard (I have nearly everything in English except for the Compendium....I'll be ordering that soon). Any pointers?

Steve

504. Looking for 'man' and 'more'

505. Interesting Dhrystone results

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-25 15:42:50 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2i3elq$n2c@crocus.csv.warwick.ac.uk>
Source record: 34780
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Living in a house at university where the occupants all own different types of computer causes a few arguments, mostly about speed. To settle this we decided to compile the dhrystone V2.1 code and test our machines. All were compiled with Gcc 2.4 or later with the -O2 flag. Here are the results:

386/20 4550 - 5000 dhrystones/sec
Acorn A410 ARM3 10000 dhrystones/sec
Falcon030 1500 - 2500 dhrystones/sec

Does anyone know why the results vary when the number of tests is altered? Also, we were under the impression that a Falcon was at least as fast as a 386/20. What has happened?

Thanks for any suggestions.

Paul

506. HELP: Questions about ADHI...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-25 15:45:18 UTC
From: vij@vnet.ibm.com
Message-ID: <2i3eqe$h2o@tornews.torolab.ibm.com>
Source record: 34786
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I think my first attempt to post this got lost... trying again...

Hi All,

I've got some questions regarding the usage of
Atari's hard disk drivers and their features...

Some background: I've got a Mega STE with TOS 2.06
and am currently using ADHI 5.00 and HDX 5.00
I've recently downloaded HDX 503C, HDX 504,
ADHI 605C, AHDI 606, and ADHI 6061.

I'd REALLY appreciate ANY answers to the following
questions. I know that there are others out there
with similar questions too...

1) What is the "best" ADHI and HDX to be using?
Are there any versions to stay away from?

2) I assume it's ok to use the latest HDX with
my MSTE, but how about AHDI? In one of the
readme files, they mention the Falcon but not
the MSTE. Is AHDI 6061 Mega STE friendly???

3) What are the differences between AHDI 606
and 6061??? (ie: was something in 606 broken).
There was no readme with AHDI 6061.

4) Assuming I'll move up to ADHI 6061 (or whatever),
how do I do it? Do I just use HINSTALL to
de-install the current driver and install the
new one? Do I need to reformat or anything,
or is it as easy as copying SHDRIVER.SYS to
by boot partition?

5) What's the relationship between SHDRIVER.RAW,
SHDRIVER.SYS, and AHDI.PRG? For a given version,
all three files are the same size. Are they
just renamed versions? It's my impression that
HINSTALL uses SHDRIVER.RAW to create a SHDRIVER.SYS.
I'm not sure what ADHI.PRG is used for...
The reason I ask is that AHDI 6061 just comes with
ADHI.PRG (ie: know SHDRIVER.RAW).

Thanks in advance to anyone who can help. I'm kinda
living on the edge 'cause I haven't backed up my

hard drive yet (I know, I know) and I don't want to
trash my drive when upgrading...

VIJ...

```

While that may get the addresses stored it does not address the real problem. The real problem being that a trap comes under the heading of EXCEPTION processing in the 680x0 familly and you need to perform an RTE instruction to properly return, instead of the standard RTS.

Since I do not know how to identify a C function as an exception handler, I would recommend that your function use an exception wrapper, written in assembler, to fix this problem.

```
EXP_RTN:
movem.l d0-d7/a0-a6,-(sp) ; save everything!!!!
bsr your_function ; maintain position independence
movem.l (sp)+,d0-d7/a0-a6 ; restore everything!!!
rte
```

Then (assuming you are in supervisory mode):

```
main()
{
void * trap_10 = (void *)0xA8L ;

...

trap_10 = EXP_RTN ;
...
asm("trap #10");
}
```

If some one knows how to implement exception handlers in C code for the ST they can help you even more.

508. Falcon Video Mode Changes (ASM or C) HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-25 19:08:54 UTC
From: oracle@iastate.edu
Message-ID: <oracle.759524934@pv0555.vincent.iastate.edu>
Source record: 34783

Hello all,

I'm experimenting with the Falcon video system and trying to learn the basics of how it all works...

What I want to do first is be able to determine the current exteneded video mode (say 640x480x16), change to a new mode (say 320x240x256), then restore the old value when finished.

I have tried to use the Atari Compendium and the Modern Atari Computers book but I can not get there 'Setscreen' or 'Vsetmode' calls to work at all in Lattice C 5.5 or Assembly.

I would greatly appreciate _ANY_ help or example source code that anyone could show me. I'm pretty new at Atari specific programming and this problem is making me pull out my hair (something that I don't have much of anymore).

Thanks in Advance...

Jason

Source record: 34785

>Atari power supplies are notorious for failing, esp under under unusual loads.

The problem may be your power supply, BUT it may also be the tristate
buffers.

Someone in this newsgroup had posted a note about the defective buffers.
The problem was with early MEGA ST. I have a MEGA ST that had this problem.

I had changed the chips and it fixed the problem. Last night I looked for the
note, but with no luck. I think the note is part of a FAQ.

If you have a MEGA ST that was produced in the first 1 yr, then I'd bet
the problem is the chips. You'll need to get a look at the article, since
only 4 are identified. The article included specific part numbers,
and manufacturer codes to look for.

I'll try and dig-up my service manual, (It is in the storage shed somewhere)

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm aware that there exists single-floppy C compilers and the like for the ST, but I would much prefer to use the UNIX powerhouses here at school for compiling. It's no problem downloading, debugging, etc.

what I want to know is if you are USING a UNIX-based GCC or G++ to cross-compile for the ST, or KNOW the details, can you help me build one on my machine?? I'm not an idiot (?) , but just telling me to use the mintlibs or the diffs or whatever isn't specific enough, as I've never built a compiler before.

any help would be greatly appreciated.

thanks

david

> rect_set(&pxyarray[4], 0, 0 , COLUMNS*CELL_W, (ROWS-1)*CELL_H);
> vro_cpyfm(handle, S_ONLY, pxyarray, &source, &destin);

Uhhh ! .... you did'nt specify the destination or the source coordinates
properly ! Your source is _smaller_ than the destination !

Try this:

```
rect_set(&pxyarray[0],0, CELL_H,
COLUMNS*CELL_W-1, (ROWS-1)*CELL_H+CELL_H-1);
rect_set(&pxyarray[4], 0, 0 ,
COLUMNS*CELL_W-1, (ROWS-1)*CELL_H-1);
```

[...]
>I used the following (similar) code:
>
> rect_set(&pxyarray[0], 0, 0 , COLUMNS*CELL_W, (ROWS-1)*CELL_H);
> rect_set(&pxyarray[4], 0, CELL_H, COLUMNS*CELL_W, (ROWS-1)*CELL_H);
> vro_cpyfm(handle, S_ONLY, pxyarray, &source, &destin);
[...]

The same problem: You did _not_ specify proper coordinates.
Try this:

```
rect_set(&pxyarray[0], 0, 0 ,
COLUMNS*CELL_W-1, (ROWS-1)*CELL_H-CELL_H-1);
rect_set(&pxyarray[4], 0, CELL_H,
COLUMNS*CELL_W-1, (ROWS-1)*CELL_H-1);
```

I hope, this helps you. If you want to transform any x/y/w/y to an x/y-
array you can use this:

```
pxy[0]=x;
pxy[1]=y;
pxy[2]=pxy[0]+w-1; /* Don't forget '-1' !! */
pxy[3]=pxy[1]+h-1;
```

Greetings, Arno

>Acorn A410 ARM3 10000 dhrystones/sec
>Falcon030 1500 - 2500 dhrystones/sec

That Falcon figure just doesn't look right. far to low.

For comparison, tests I've done/seen are:

386DX/25 8000
Acorn ARM 3 36Mhz 17000
STE 25Mhz 2700
MSTE 2000
STFM 1300

These are only approximate figures, and were not all done on the same C source version of dhrystone so are not *strickly* compariable.

I'd expect the Falcon running single TOS in ST Hi Res to make at least 4000.

Roland.

@CiX.

I've been doing this since ... 1987. Works great, as long as you can tolerate
the transfer time getting the actual binaries down to your ST.
>
>thanks.. and any recommendations for a good book on GEM/TOS
>programming would be helpful, too. I have the atari compendium btw.

I started programming on the ST with Mark Williams C 2.0, and except for the
newest stuff, I still find myself referring to their manual most often. For
other info, I have the Sybex Programmer's Guide to GEM, as well as the Compute
series of ST books, a couple of the DataBecker manuals, and the Concise Atari
ST Reference manual. As well as the Atari Developer's kit. But actually,
since I bought the Compendium, I haven't used the others lately...

>any help would be greatly appreciated.

If you've never even built the GNU compiler before, then I suggest that the first thing you need to do is get the full compiler source and build a native version of it on the Unix box you're going to be using. This is a relatively simple process, but if you haven't even done that then it's far too soon for anyone to be telling you what changes need to be made so you can cross-compile for the ST. Once you're familiar with the build process, and once you're confident you can create a compiler that will work *native* on the host you're using, *then* you can think about setting up the cross-compiler. You will need to use the native GCC to build the Atari cross-compiler.

If you've never used the "patch" program to apply changes to a file, you'll need to hunt that down and read about it as well. Once you've gotten this far, you won't need any help configuring the GCC source as an ST cross-compiler.

You will need to grab the C library and include files as well, so you can build the Atari C library on your Unix box, and use those include files when compiling your own programs.

Everything you need to create a complete development environment on a Unix box can be found in the Gnustuff directory on atari.archive.umich.edu.

HDX is the package ATARI uses to format and partition the Arari hard
disks.
It should be generic because the support for a particular HD type is in
the ascii
file "windcap". Hence the support for a new HD type can be added by hand
there
How this has to be done, I don't know ?!

AHDI is the the HD driver.

>4) Assuming I'll move up to ADHI 6061 (or whatever),

> I'm not sure what ADHI.PRG is used for...
> The reason I ask is that AHDI 6061 just comes with
> ADHI.PRG (ie: know SHDRIVER.RAW).
Renaming AHDI.PRG (V6.061) to SHDRIVER.SYS and using HINSTALL
showed that my HD seem to boot with the new driver.

Beside this I noticed that since the ADHI Version 4 the driver wants
to read some identification from the controller. And does not recognise
controllers anymore like the one from VORTEX. I have a SH205 (20M) and
a Vortex 30M. I am only able to access the VORTEX (my 2. driver) with
AHDI V 3.01 above this version I can only access the original Atari HD.

I have made some Dhrystone benchmarks months ago (there was a "discussion" in
.advocacy ;-). These are the results:
F030, TOS 4.01, 640x200x2 (60 Hz): 2777 Dhrystones.
The resolution is very important, for example:
F030, TOS 4.01, 640x240x256 (60 Hz): 1851 Dhrystones.

I have also checked the Falcon without Caches. If you switch the caches ON
you will only get a 15-25% improvement. This does NOT fit in the tests I have
made with some Standard Applications. The avarage improvement in "real life
situations" is 72%.

Result: The Dhrystone benchmarks aren't Cache-friendly (they don't seem to
fit in the F030-Caches). As the F030 only has a 16 bit data-path to the
memory, the results of the benchmarks turn out bad.

Ciao, Heiko.

518. Falcon speeder problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-26 09:26:24 UTC
From: h54118@sakura.kudpc.kyoto-u.ac.jp
Message-ID: <h54118.759576384@sakura>
Source record: 34698

Hi,

I recently installed a speeder into my Falcon.
It speeds the CPU to 32 Mhz, this can be switched on or off
by software.
In addition the FPU can be speeded to 32 Mhz independantly,
i.e. this is not switchable (and not quite so easy to install).

It took me several days to get to the present state of
functionality:
CPU at 32Mhz works fine, i.e. programs, which don't access the FPU
run faster. This took a lot of experimenting: making the cables
longer and shorter, trying ferrite pearls etc.
Prgs which access the FPU run SOMETIMES, as it seems, as soon as
the whole machine got warm enough. Then speed increase is a very
pleasant 100%.
What doesn't work at all is 32 Mhz CPU on and FPU access, i.e. I have
to disable the 32Mhz for the CPU first.
Otherwise, like when the machine is still too cold, I get a copro
protocol violation (btw., also under Multitos!?).

Now the installation guide says, that maybe the phase lag has to be
corrected using a 47pF condenser between pin 11 of the FPU (clock)
and ground. Unfortunately it doesn't say where to find this ground.
I tried two - poles of nearby electrolytic condensers but things got
worse.

The speeder is from Richter Distributor in Germany and consists of a
beige sealed plastic box fom which seven cables emerge.

Anybody with similar problems or an idea?

Any help will be greatly appreciated,

Christian

Working on ZFCs text editor Edith, I found the following curious problem:

When searching for a file (SCRAP.TXT on the clipboard) at regular intervals, shorter than the write delay of my disk cache, the cache never gets flushed. Which is strange, because even when I write other data to the cache, it is kept there. My solution is to allow the user to set the clipboard sensing interval.

Let's bloody well hope they don't. (I assume by 'non-Atari' you mean
MS-DOS or Mac users, since UNIX boxes should be considered a different
market and interest segment.)

Not that time-consuming if you've already spent time on the routines for
editable texts. The rest can almost directly be derived from that code.
I am seriously thinking of doing it soon, because once you've got the
routine, it'll be very easy to port applications to X or MS windows.

That's due to the layout of the Falcon-memory: The TOS is located at 0xE00000, and that physically overlaps with the last 2 megs of the 16MB-expansion (16MB would end at 0x1000000). So you can only use the first 14MB. When you look at the code of TOS which determines the ammount of memory the Falcon has, you will find a part that reduces 16MB found to 14MB...

HINSTALL installs SHDRIVER.SYS to the root directory of the boot
partition of the HD, but that's not the whole story. It also
changes some internal info on the HD that makes it bootable (when
you install) or non-bootable (when you remove). Simply copying
SHDRIVE.SYS onto your HD won't make it bootable, and deleting it
will likely cause your system to fail during booting (should be
easy to fix after booting wit the Alternate key depressed,
though).

>Beside this I noticed that since the ADHI Version 4 the driver wants
>to read some identification from the controller. And does not recognise
>controllers anymore like the one from VORTEX. I have a SH205 (20M) and
>a Vortex 30M. I am only able to access the VORTEX (my 2. driver) with
>AHDI V 3.01 above this version I can only access the original Atari HD.

I don't know whether you suspect this, but the SCSI ID that AHDI
tries to obtain during booting don't seem to have any influence
on its further operation. The names are simply displayed while
booting, probably so you can figure out what devices were found.
When a device doesn't return an ID, such as a Megafile 60 (which
harbors some ugly, 5 1/4 inch non-SCSI HD), AHDI says
"Identification unavailable", but continues to work.
I don't really know, but the Vortex problem *may* have to do with

the WINCAP info. Then again, I faintly recall having read about
third party hard disks that don't support the ACSI protocol (i.e.
the ACSI commands) fully, and that operating such HDs with AHDI
may lead to data desasters -- so, it might also be that AHDI
refuses to access the Vortex disk deliberately.

>support the 40 windows.

Not true - earlier TOSes *do* allow more windows. The desktops don't,
but that (as they say) is another story... I'm running UK TOS 1.04 and
WINX 2.2 with no problems.

You do have to mess around with the other \auto programs to get WINX
installed properly - the best indicator of a correct install is the
WINX.CPX displaying four scroll bars (for scroll-bar delay and stuff).
If they don't appear, WINX isn't alive.

I spent hours juggling my auto folder, if that's any guide... Prime
candidates for juggling are UIS III (although *very* new versions are
Ok) and almost anything else that patches the AES.

>as fast as a 386/20. What has happened?

It is well known that the Dhrystone benchmark is poorly constructed. Due to an error in the way the original analysis of program data was carried out, Dhrystone basically reduces to a test of how fast string operations are implemented.

Using the same compiler was a good idea. Since you were all using gcc, you should have all had the same string library (libgcc.a) -- check and make sure. Also, using different versions of gcc is a bad idea: you'll get differences there.

I also don't recommend the use of -O2. The point of doing a benchmark is to see how long it takes to execute some code. If you switch on heavy optimisation, your compiler may well remove code that the benchmark is trying to measure!

One problem with small benchmarks like Dhrystone is cache effects.
If the program and/or data happen to fit into the cache of one machine, it will have an advantage over a machine where this is not the case. I suspect that this is probably the cause of your problem (and if you turn off the optimisation, code size will probably increase and change the cache effects again)

Finally, make sure you eliminate all other activity while running the benchmark (this can also affect the cache). This includes interrupt handlers (turn off interupts) and bus contention (e.g. video access).

Mat

PS:
I did an in-depth study of benchmarks and benchmarking for my MEng degree.
You may (or may not!) be pleased to know that I showed that it is impossible
to construct a single program which is representative of programs "in
general".

Since for having ST-compatibility, you need the adress-room from $00e00000
(the start of the Eproms) to the hardware-adresses at $00FF8xxx.

Though this is mirrored in the Falcon to $ffe0000 -> $ffff8xxx, it is not
possible to have RAM _AND_ the hardware-adresses there :-(

I had some difficulty with my SM147 when I first installed it on my Mega2 ST. When the computer booted it wouldn't detect the High resolution and would boot in Medium rez. Problem was traced to the ICD Hard drive Utilities. ICD sent me some capacitors to solder to the MegaST Mother board and now all works well. Of course if you are booting without a disk then this probably doesn't apply to your case.

Hi,

As I see it, when you buy a Falcon in Germany it's cheaper than a TT and
I've got more power as with my old Meg2. Another really nice expirience is
to have some really good Screen-Resolutions (with Screenblaster and
a MultiSync). Since I'm studying Linguistic Computer Science
(best translation I can think of for `Linguistische Informationswiss.')
the `Sound Features' come in very handy and even if I wouldn't need
them they are still great fun.

Someone already mentioned that software is in Germany the least of all
problems.

As to Memory requirements, I decided to use most of the time a
MiNT-only System (Black Screen One Cursor), Oh yes my only need
for the MTos is when I use MultiTeX and want to view, edit
and tex at the same time, and this is no problem with 4Meg.
My only problem is to use GCC and Emacs at the same time.

I think if you really need more Memory, try to get Fast-Ram.
My Dream is an Eagle with 040 and lots of FastRam.

Just a opinion,
Bye,
Sascha Djuric'

I have already sent him the following:

This sounds like a termination problem. Does the physically last device
in your SCSI-II chain have terminating resistors? Make sure that ONLY the
last physical device in your SCSI chain has terminating resistors. If your
drive (the mechanism not the case) has terminating resistors on it make
sure that you do not have terminating resistor pack on the SCSI-out
connector of your case (if you have a SCSI-out connector). I personally
recommend that you only use the SCSI-out terminating packs and remove any

terminating resistors on the mechanism. This allows you to be absolutely sure of proper termination.

The terminating resistors on the mechanism are typically located next to the SCSI connector and are normally 4 inline resistor packs running parallel to the SCSI connector. If you see a line of about 30 empty holes there are no termination resistors on the mechanism.

The only other thing I can think of is that your SCSI cable is bad. Try to borrow a different one.

The SCSI-II specification requires parity and to the best of my knowledge the Falcon provides/requires it also.

In case anyone is waiting for someone to answer with some advice on how to reset the IKBD device safely, I'll give a partial answer to myself: a Vsync() call immediately before the Ikbdws() call to do the reset seems to reduce the number of problems dramatically.

I have had pretty close to the same problem when I attempt to make changes to
the Falcon Screen with Opcode 5 and 88. I posted a similar question a few
days ago and got no replies.

If someone does happen to mail you the solution, please take the time to post
it here for all to see. I could surely use it at this point.

thanks in advance.

550. Adding/Replacing HD

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-26 22:58:14 UTC
From: gregk@nskernel.tandem.com
Message-ID: <CK9EH3.AED@tandem.com>
Source record: 34541
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I recently posted about disc compression programs - one of the responses suggested looking into a new or extra hard drive and that they can be picked up relatively cheaply, in particular, on misc.forsale.computers.

Okay, now I'm looking into what's involved in adding a HD or replacing my existing HD. I have a Supra 30Mb drive which I think has a Seagate ST138 drive and Seagate 138N controller. It also has a 25-pin port on the back with some instructions on how to make a cable for this port with a 50 pin (SCSI?) connector on the other end.

Is it possible for me to replace the drive in my system with an off-the-shelf SCSI drive? Does this involve getting a new controller as well? When I went to a local store yesterday, I noticed the drives have a 50-pin connector, but the controllers are more specific - like for a PC.

If I can't replace the drive inside my Supra, how do I attach another drive via the SCSI port on the back? Do I just need to buy a drive with power supply, make the cable I talked about above, and plug it in? Or do I also need to add a controller?

If I have other options, please let me know. I must say I'm not clear about what 'pieces' connect to the 50-pin SCSI connector, and where the controller fits in to the picture.

Thanks for your help, Greg.

551. Building a gcc cross-compiler???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-27 01:12:48 UTC
From: paul@jupiter.ame.Arizona.EDU
Message-ID: <2i74eg$hc1@auggie.CCIT.Arizona.EDU>
Source record: 34732

I've been trying to build a gcc cross-compiler for my Atari on a Sun-Sparc I have here (os 4.1.3). I've got the gcc 2.5.8 sources, and the cross-compiling Atari Makefile--"Makefile.cross" along with the docs for doing this. I'm quite sure I've followed all the directions on how to do this. The problem I get is that when I run gcc, it doesn't look in the right places for the other (cpp, cc1) execulables. It just says:

ccp -blah -blah ...

when it should be saying

/dir/.../dir/lib/gcc-ccp -blah -blah ...

The prefix definition is correct when gcc.c is compiled, i.e.,

-DSTANDARD_EXEC_PREFIX=\"/dir/.../dir/lib/gcc-\"

but that's the last I see of it. Just to be perfectly clear, this is the actual gcc.c compilation line:

```
/usr/local/bin/gcc -DCROSSDIR=\"/home/jupiter/paul/gcc.st\" -DCROSS_COMPILE -O \
-DCROSSATARI=1 -I./config -I. -c \
-DSTANDARD_EXEC_PREFIX=\"/home/jupiter/paul/gcc.st/lib/gcc-\" \
-DDEFAULT_TARGET_MACHINE=\"atariST\" gcc.c
```

I added the -DCROSS_COMPILE to the original but it made no difference.

Any ideas on how to get this to work?

thanks.

I haven't tried yet, but here are some hints:
1. Physbase and Logbase are Long-Integers!
2. There is an error in the memory allocation of setscreen. You better allocate
the memory yourself. There is a XBios-Function which calculates the needed
memory for your modecode (I don't remember the name...).
3. The P-Flag is not interpreted correctly by setscreen(). You should make
a Vsetmode() with the same modecode after the setcreen()-call.

Ciao, Heiko.

From a discussion a month or so back, you only need to recheck the clipboard directory when you *know* another application has been running and the user has switched back to you. You will know this because you will receive a WM_ONTOP (it might be WM_NEWTOP, come to think of it).

For AES versions that don't send this message (WINX does send the message!), your solution is probably a good one.

Your disk cache sounds rather suspect though - what is its name, so we can avoid it ;-)

But is is possible to switch this compatibility off somehow (say by toggling
a bit in the memory controller) ?
This would be handy if a real OS ever gets ported.

BTW I've always hit the hardware at $FFFF8xxx even on the ST because you can
use short addressing mode (sign extension!) and save a few cycles.

Right, I've spent monthes on this one now & I'm fed up.

I cant't get the more recent versions of the Minix filesystem to run
stabley. With pl8 or pl9 the average time to a system crash is 60 seconds
- memory violation: Type hardware (update)

I've tried with no other software installed apart from the MiNT kernal using
the following versions

0.99,
1.04 (official with multiTOS),
1.08 (68030 specific version).

I have a falcon 030 4/65 so memory is no object. The older versions of the
filesystem work fine (pl0).....so why can't I get the newer (v2 filesystem
turbo mode) to work.

I've tried the a.a.u.e binary & I've recompiled myself using mintlib pl39.

End of my tether..........HELP !!!!!!!

It could be possible to use those 2 Mb as alternative RAM. Maybe someone with
14 megs should try that out.

> BTW I've always hit the hardware at $FFFF8xxx even on the ST because you can

562. Phantom typist?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-27 15:13:50 UTC
From: saj@chinet.chinet.com
Message-ID: <CKAnn2.1CE@chinet.chinet.com>
Source record: 34554

There used to be a lot of discussion of "the phantom typist," in which the running application would receive a slow stream of keypresses, and then crash. Moving the mouse rapidly at the first sign of trouble would stop the phantom, but the machine would remain in an unreliable state. I hope this description matches what people remember....somehow I never encountered it myself.

Anyway, I'd really like to know if anything was decided about how to program to avoid the phantom. There was a claim that version 3 TOS-s are much less susceptible ot it: any experience out there on the subject?

Steve

>>left with is no longer a straight line (and occasionally contains holes).

Very annoying indeed. The same seems to happen with straight lines, if
you're using patterns. My 3D buttons get scrambled if you drag windows
over them using WINX. Does anyone have a smart solution? I guess
you'd have to blit the lines (or in my case, a complete button)
yourself using vro_cpyfm...

A solution for the lines may be to lock the screen, top your window,
draw a picture, store the image, release the lock and use the saved
image for updates.

>Any information regarding other accelerators (if there are any) or
>the various memory expansion boards that exist will be most
>appreciated. Thanks!

There are some much cheaper solutions:

1) PAK/3 accelerator (a project from the german c't magazin), allows you
to expand your memory with fast RAM (I've heard - maybe THIS is
not ready yet)

2) (PAK/3 fastRAM expansion)

3) VOFA (`VolksFarben', like `Volkswagen ;-), a `shareware hardware' project,
maybe in Internet, an ET400-based (S?)VGA-card

I have to pay DM 550,- (about $200-250) for the PAK/3, the VoFa is between
DM 100-200 (about $50-100).

This is definitivly the cheapes and maybe one of the best solution. The PAK
is a kind of `open project' and machine-independend, so if you try to speed
up your small little old Mac you can use this card, too. For VoFa you can use
the `famous' NVDI ET4000 drivers.

Greetings - ketchup

If you're talking about my column, I don't think that's what I said. The
relevant text follows:

------------------------------cut here-----------------------------------

I was debating this very issue while writing GEMBench. Rightly or
otherwise, my conclusion was that a benchmark program should limit itself
to purely performing tasks. The memory tests in GEMBench simply reads the
computer's memory, the text and graphics test do just that. Any attempt to
immitate a 'real-life' situation as some benchmark utilities for the PC
do, is totally subjective and open to scrutiny. The downside of my
approach is that one has to read the figures with caution.

This seems like a simple enough question, but all my tinkering has produced no results so far. In the 1280x960 monochrome mode, is there any way to invert the screen so you get white foreground/black background instead of the current black on white? I *hate* looking at a white screen... Just flipping the bit in palette 0 has no effect.

>--
>------------------==------------------
> cherborth@semprini.waterloo-rdp.on.ca
> Chris Herborth

This message strikes me as being vindictive rather than informative. I'm
not sure what the point is.

The question shouldn't be which features wouldn't be useful; the question is
whether a potential buyer finds those features attractive. When you shop
for a computer, shouldn't you find out what it can do?

As for getting "support", that's meaningless too, unless you can specify what
kind of support. If you mean repairs, well, buying Atari means shipping it
off to get it fixed, and waiting. It comes with the territory.

Now, why grouse about having enough RAM for MultiTOS? Sure it's crowded in
four Meg. At least it's workable! You can't even boot Unix in four meg.
Linux and MS windows will wear out your hard disk paging in four meg. It's
a testament to clean programming that MiNT uses as little space as it does!

I do agree that Atari could have made it easier to upgrade by allowing an
intermediate step between 4 Megs and 14. However, you aren't going to save
an awful lot by going to 8 megs anyway, and serious users may want the extra
room.

As for software, what do you mean? Telecomm? Midi? DTP? Word Processing?
Spreadsheets? Databases? Editors? Unix programs? Compilers? Games?
There's loads of them.

State of the art? Probably not. Specialized productivity stuff? Not there.
But that's no reason to dig a hole and toss it in!

Perhaps a dose of perspective is needed. All cars can't be Ferrarris, but they can get you about more than adequately!

570. No sound when MegaSTe cold-boots

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-27 21:08:55 UTC
From: a07649@giant.rsoft.bc.ca
Message-ID: <2i9ah7$3gl@deep.rsoft.bc.ca>
Source record: 34547

Hi,

I have an unusual (I think) problem with my MegaSTe. The configuration is TOS 2.05, 4 Mb RAM, Monochrome, two floppy drives, external SCSI hardrive with ICD host adapter.

The problem is, when I cold-boot (power on) there is no sound from the speaker--no keyclicks, no beeps, nothing! But, if I re-boot with CTRL-ALT-SHIFT-DEL or by pressing the reset button, the speaker then works. The problem ONLY occurs after a power-up.

I have tried booting up "clean" ie, no accessories, and no programs in the AUTO folder. Same thing.

Also, I removed all external peripherals and booted from floppy. Same thing.

After the power-up, if I look at the control-panel accessory, I see that the keyclick icon is dimmed out. But I can't seem to undim it.

Has anyone heard of this happening? Does anyone know if this is a hardware problem or TOS? And lastly, how can it be fixed? Is there a program I can run in the AUTO folder, for example?

Thanks in advance. ANY and ALL help much APPRECIATED!

Not to mention that the TRAP routine is somewhat weird!
C compilers put a RTS command at the end of a subroutine.
A TRAP routine is left with RTE!
Also dont put code into your TRAP handler that call
the operating system. TOS is not reentrant!
DON'T use printf, getchar and the like!

>
>Up until now I have only wanted to get single mouse clicks (clicks = 1).
>Now I wish to have a single evnt_button that informs me if a single OR a
>double click took place.

Waiting for double clicks can easily be accomplished by increasing the value of clicks:

clicks = evnt_button(2,1,1,&mx,&my,&mb,&mk)

Even more useful is adding 256 to the value of clicks. Now you can specify which event you are *not* waiting for! By calling

clicks = evnt_button(256+2,3,0,&mx,&my,&mb,&mk)

you inform the AES that you are *not* waiting for both buttons to be released. Effectively, this means you are waiting for any one of the buttons to be pressed (either single or double click). This way you can check both buttons independently.

Happy hacking,

Your column started quite admirably, saying what a waste of time that
benchmark programs are. Then, as you quoted above, GemBench does exactly
what you criticise the others for.

Such benchmarks can always be used to mislead people (See Systems Solutions
misuse of your own program in their T28/T36 ads, for example; they do not
compare 8MHz with 28/36MHz, but compare 8 w/o NVDI to 28/36 with).

I had a similar problem with the power supply in my 1040STF.

Turned out to be a cold solder joint on the power supply board.

As I recall, it didn't take too long to re-heat all connections on the board.

This may sound like a wacky idea to some...

I was thinking this morning that it's too bad the STE doesn't have audio sampling built in... Then I got thinking about ADCs and something snapped! It DOES have a pair of ADCs! In the never-used analog controller ports! Could these somehow be rigged up for audio sampling? I wonder...

They're probably pretty cheap/cheesy ADCs, but they'd probably work...

Can anyone with more programming/hardware knowledge than I enlighten me on this matter?

danke!

>page appears. After exiting more you then get all the 'missed' spaces echoed.
>I suppose this is a generic problem when running any TOS/TTP program in
>Gemini's console window.
>Has anybody else noticed this

Oh yes!

The reason for this behaviour may be that programs that are started
in the Console window don't become extra processes, but the run under
the process id of Gemini. (Even Mupfel in the Console is no extra process).

But, the programs you run in the Mupfel window are TOS-Programs with
receive their keyboard inputs from Gemdos- or Bios calls. Gemini itself
(including the Console windos) is a GEM Program that uses AES Calls for
Keyboard handling. It looks like this both methodes within the same
process conflict under MultiTOS.

? Any explanation and/or fixes or workarounds known

The only fix with is know to me is: Don't use the Console Window under
MultiTOS.

The Mupfel Shell is also a standalone program (MUPFEL.TTP) which is
startable in TOSWIN or MINIWIN. Then, Mupfel is a TOS process and
the problems with running TOS programs disappear.

By the way, if the Mupfel shell runs under TOSWIN/MINIWIN, your mouse
arrow won't disappear while more-ing a file or anything like it does
in the Console.

This method has also a few disadvantages, e.g. the cd $TOPWIND command
whith is defaulted to function key F1 by profile.mup won't work anymore
because Gemini and TOSWIN/Mupfel have different environment variables.
But this things don't mind very much.

Bye, Harald

>what you criticise the others for.

I don't see what you mean. All I wanted to tell people is that benchmarking is useful, but the results should be read with caution. Are you suggesting that there is no need for benchmarking at all? I didn't imply that benchmarking was useless, at least I didn't mean to. I just wanted to let readers know that it shouldn't be taken too seriously.

I wrote GEMBench for my private use, but gave copies of the early versions to friends, and before I knew it, everyone was using it. I think that as far as benchmarks go it's quite good. If you have any relevant criticism, I would be glad to hear it. Many suggestions from users have been incorporated along the way.

>Such benchmarks can always be used to mislead people (See Systems Solutions
>misuse of your own program in their T28/T36 ads, for example; they do not
>compare 8MHz with 28/36MHz, but compare 8 w/o NVDI to 28/36 with).

True, but you can't blame me for that.

Yes there is: write your own VDI screen driver.

Hi,

As some of you are aware, I am having some trouble getting Ghostscript to properly display 16-bit color on some graphics hardware. I seem to be quite misinformed. Some authoritative answers to the following questions would be helpful:

1.) Does all 16-bit graphics hardware represent a pixel as a single word (i.e. 16 consecutive bits) of rgb information (rrrrrgggggbbbbb) and use no lookup table. It seems that the 32K mode of the Crazy Dots board does something different, but WHAT? Does it use some interleaved format? The Crazy Dots vdi reports that there is a lookup table in this mode. Is there some way to find out from the vdi what format is used?

2.) Does vr_trnfm() work properly on the Falcon in 16-bit mode. I have heard rumors that it does not.

My third question requires a little background. Ghostscript creates a bitmap in memory, which I must then transform to the proper format and display on the screen. GS asks the screen driver code to tell it what bit sequence to use for a given color, so I cannot draw directly to the screen with the vdi. I have to somehow find out (using portable GEM calls) what bit sequence corresponds to what color.

3.) Is there a problem (an any hardware) with the following procedure to find which bit sequence corresponds to which color?

a.) Use vs_color() to set one pen (say pen 1) to the desired color.
b.) Use the vdi to draw one pixel to the upper left corner of the screen.
c.) Copy the first 16 bits of screen memory to find the bit sequence which corresponds to the desired color.
d.) Tell Ghostscript to use this word to represent a pixel of this color.

Clearly this won't work if an interleaved format is used, but how do I find out (with function calls) whether the bits for one pixel are interleaved or consecutive in memory?

I know I have been asking questions similar to these for a long time, but I still don't seem to have enough correct information to get working 16-bit color on all hardware.

Thanks for any help.

I don't think he ment a Gemdos cache, since he's using Minix filesystems.
The only standalone cache at BIOS level that I know of is TCACHE. Haven't
tried it though -- still happy with HuSHI.

Hi,

My ST has a heat-related problem that causes the machine to hang when accessing the hard disk for just about anything nontrivial. Does anyone have any suggestions for pinpointing the problem (dma chip, ICD card, drive itself)? I know it is a heat problem, because it goes away if I open the case (it is in an IBM PC case with the usual fan in the power supply) and blow on the board and drive with a big room fan.

>>>>>>> Sequence of events during failure: <<<<<<<

Machine accesses hard disk,
Disk access light comes on,
Dialog stating "data on disk may be corrupted ..." appears (sometimes bombs instead). The ICD board reports no sense errors or other errors of any kind. The data is really fine, since everything works fine with the big fan.
Disk access light remains on, even if the dma cable to ICD card is unplugged or power to icd board is removed,
Machine must be rebooted, first reboot always fails -- won't reboot from hard disk,
Further attempts to reboot may fail depending on whether the drive hangs during the boot.
The floppy drives seem to be unaffected -- they still work OK.

>>>>>>> Failed attempts to fix the problem: <<<<<<<

Reseat chip ritual -- reseated ROMS, DMA, MFP, floppy controller, and MMU. Tried this may times.
Reseated SCSI, dma cable, and memory board connections.
Felt all chips to see if any seemed abnormally warm. All seem quite cool.

>>>>>>> Hardware information <<<<<<<

I have an old 520stf (TOS 1.0), from around 1984 I guess. It has 4M of ram on an Aerco board, an ICD SCSI board (85M Quantum drive), and a midi port modification (slowed the baud rate) which allows the use of a DEC keyboard.

Any suggestions for how to pinpoint the problem? Can I take the drive to a local PC store to be tested? Can I eliminate the ICD card as the source of the trouble? Is it time to get a Unix box? Any help would be appreciated.

Thanks,

-Tim Gallivan

: Result: The Dhrystone benchmarks aren't Cache-friendly (they don't seem to
: fit in the F030-Caches). As the F030 only has a 16 bit data-path to the
: memory, the results of the benchmarks turn out bad.

What's this about a 16 bit data path? The manual clearly gives the data bus
width as 32 bits and recent Net arcticles on memory upgrading have stated that
four 8/9bit SIMMs are needed in parallel to provide the required data width.
Anyway, if the Dhrystone benchmarks are oriented towards memory access speed
a 20MHz machine is likely to be faster than a 16MHz. (Of course, accessing
screen memory over the expansion bus on the 386 would be slower, and a 386
can't decompress JPEGs quickly like my Falcon can with its DSP etc. etc.)

|> Falcon030 1500 - 2500 dhrystones/sec
```

Strange. My ST with a 25 MHz 68030 board has roughly 4300 d/sec when compiled for 32 bit ints. I've used gcc 1.37, gcc 1.40, and gcc 2.3.3 pl 1. I can reach over 5000 d/sec with -mshort. The Falcon should have roughly the same speed since its slower CPU is compensated by its faster memory bandwidth. Are You sure not to have forgotten to optimise (although You said You did)?

hi there,

i'm using MiNT 1.04/Tos 1.04 under the bellcore window manager.
with several 16 MB Tos partitions. In my setup, i've
removed the 'ttp/tos/prg' from all executables, since i'm trimming the system
more and more to a unix lookalike, and, more important, since command name
completion of my interactive shell tcsh does not work correctly when the
names of the executables have an extension.

Now the problem for any of the sh clones i tried (different ports of ash, the bsd
sh clone):

when i try to execute the command, i get the error 'access denied'. If i add an
extension (.ttp) to the command name, everything is fine under sh, but not under
tcsh. (Hence, PATH is set up correctly). If i have the extensions removed and
use an "absolute" path name, e.g., /bin/ls instead of ls, sh has no problems to
execute the command.

Does anyone know what's going on? Is there any sh clone available which
does not have this problem --- possibly compiled with shared text? I intend to
use the sh only to execute system() calls, shell commands from make and to run
one or the other shell script, and I'd like to spend my time to develop/port
useful applications for the community instead of debugging shells :-) (at present
i'm working on ghostscript 2.6.1 with a driver for the MGR, gnuplot for the
MGR, port mgrsketch from Linux-MGR, and a DVI-driver for the MGR better than
dvimgr.)

Thanks for any help

Personnally I think they are not real ADC but arranged as the analog joystick are at the amiga (Too bad I can't explain how it works on amiga since my english is quite limited :-)).

But what I do know is that when I tested the port myself I put a steady voltage on the input but the register didn't show a steady value(jumped up and down 5 steps). Also the samplings frequency at the ports is around 1,000 Hz(!) from what I heard and it's not very good for sound anyway.

Hello Greg,

There are a minimum of four pieces in any Atari ST hard disk system (not
counting the Falcon030). These are:
1. Host Adapter
2. SCSI Hard Disk Drive
3. Case
4. Power supply.

The host adapter is what you're calling the controller; I think yours is
a Supra(?). As you've noticed, Supra used a nonstandard 25 pin SCSI connection
on some of their host adapters. The common 50 Pin connector has every signal
pin intereaved with a ground pin to minimize noise interference in the wide
ribbon cable. Later Supra adapters had both the 25 pin and the 50 pin
connections.

A host adapter is what allows you to plug a SCSI device into a non-SCSI host computer; in this case, through the Atari DMA connector. Although you can still use the Supra if you choose your SCSI drive carefully and cable it properly, you're limited in your choices of drives to connect. Check your formatting software, SUPFMT.PRG, and see what drives it lists. If you choose a newer SCSI drive it may not work, since you may not be able to format it (or even *find* it) with the Supra formatting software.

A single host adapter should be able to connect up to eight SCSI hard disks to your Atari. Once you have a 50 pin SCSI ribbon cable, you can put several connectors on it and chain multiple drives (I have four right now). However, each drive needs to have a unique ID set, via jumpers, so that the computer can tell them apart. For each unique ID you can also have multiple Logical Unit Numbers (or LUNs), but this is not significant unless you're using an unusual controller. You just need to check the IDs of each drive and make sure they're different.

There's usually three jumpers somewhere on the drive's circuit-board, labeled A2 A1 A0, with a jumper or two on the pins above them. These jumpers can be read as binary "1", so that, for instance, if the first two are empty and the third (A0) has a jumper, the ID is 001. If you have only one hard disk, most likely all three sets of pins are un-jumpered, giving you SCSI ID 0. If so, when you add more drives, make sure their IDs are higher numbers.

If you have the money, I'd recommend that you get a newer host adapter, such as ICD's "The Link". This adapter should work with any current SCSI or SCSI-II drive, or even a CD ROM drive. The software is up to date, and will let you format nearly any popular unit.

Another consideration, when you expand your system, is what the power supply can handle. If you can read the output current in Amperes for your supply, you can calculate its capacity using volts * current = watts. Add the draw of the present drive plus the one you want to use, and see if it's below the limit.

Hope this information helps your efforts. Best of luck!

Hmm, well, let me clarify some stuff. I have an 4 MB MEGA/STE with a built
in 50 MB HD which is hooked up to the ICD adapter. The external ACSI
port of the MEGA has been changed into an external SCSI port from the
ICD adapter. The guy I built this machine from hooked up an external SUN
SCSI drive and at that time the ICD software was worked perfectly. So I
assume he didn't put any additional ICD hardware in his SUN HD since he
was gonna use it on his new PC. Any ideas? Thanks for the info so far but
I need to know if I can get it to work with a terminator or if the
solution is a "bit" harder than that :-)

Thankx again & Please Help!

This is ICD's standard cache behaviour. As long as there's any access, caches
are not flushed.

Solution for you: Don't poll the clipboard, just keep "Paste" available all the
time, and pop up an alert or ring the bell in case there's nothing to paste
when the user wants to.

bye, Peter

From: jchen@Auspex.COM
Message-ID: <19764@auspex-gw.auspex.com>
Source record: 34580

My seven year old Mega ST2's floppy drive is having trouble reading several disks and is making rather loud noise even when it's capable to read other disks. I tried to replace it with a SONY 3.5" 1.44MB drive with no success. I wonder if there is any place I can buy a 720KB (Teac?) floppy drive that works for the machine.

The drive could be just mis-aligned but I figure the cost of having a tech to fix it may be more than the cost of a replacement. The SONY drive I tried can be bought for less than $50.

Also could the high density drive (1.44MB) be used in the Mega? I still have the stock ROMs which probably don't support the drive.

Any help is highly appreciated.

That would do for ST-HIGH. Try not just flipping the lowest bit, but
exchange the color values for the two colors (either 0/1 or 0/255, can't
remember), maybe this one helps. I remember having heard the term
`duochrome' instead of `monochrome', so I think there's a software
solution like this.

If you continue to dislike the white screen, give me the monitor! :-)

Well, you've installed it right, AFAIK, but you can't make C library
calls from a trap handler! I'm _pretty_ sure you can make other TRAP
calls, but I don't take my word for it... who knows what would happen if
you called another TRAP that called your TRAP handler, which called that
TRAP, which called your TRAP handler, etc, etc... (probably a whole line
of bombs.. ;-))

One problem you might have with buying a Falcon is where to buy it...
it's had almost no market acceptance. Then again, you're in .de, so
maybe Atari still sells products there. :-(

If you buy a '486, you will have nothing but problems, *unless* you
never upgrade anything, never add any new cards, never use anything buy
DOS and Windows (yuck, the worst possible OS/GUI combination to put on a
PC), etc.

IMHO, you should buy a used UNIX workstation; Sun and Hewlett-Packard
machines are quite nice.

Ok, you say your internal 50mb disk has an internal ICD host adaptor on it?
If so, it would have to be an ICD AdSCSI Micro. Note that Atari did not
use these units, but had their own (inferior, IMHO) board. Thus, are you
absolutely sure that the internal has an ICD host adaptor?

> The external ACSI
> port of the MEGA has been changed into an external SCSI port from the
> ICD adapter.

If by "changed into" you mean that there is an inline external plug that
has ASCI on one side and SCSI on the other, this must be an ICD Link.
However, you say "from the ICD adaptor", implying that there is only one.
This is weird, as I am pretty sure the ICD Micro can only drive one disk.

> The guy I built this machine from hooked up an external SUN
> SCSI drive and at that time the ICD software was worked perfectly. So I
> assume he didn't put any additional ICD hardware in his SUN HD since he
> was gonna use it on his new PC.

If the Sun drive used the Centronics (printer looking) style SCSI plug, this
also lends support to the theory that you have an ICD Link on the back of
your machine.

> Any ideas? Thanks for the info so far but
> I need to know if I can get it to work with a terminator or if the
> solution is a "bit" harder than that :-)

Termination is not your problem. If you have an internal host adaptor and
an internal drive, it should work without any termination concerns, even
if you have other stuff hooked to the ASCI port on the back of the machine.

Now, as to your problem. You need to send a more detailed description of
your system. For example, exactly what does this "ASCI changed to SCSI on
the back" plug look like? Is it a trapezoidal DB-15? Is it some sort of
50 pin SCSI? It should be a DB-15! If so, I can think of no way your
internal host adaptor could "change it into" a SCSI. As for the guy that
hooked the Sun drive up to your machine, did he use an ICD Link? Do you
have an ICD Link? It would be hanging out of the back of the machine if
you did (it is an inline unit a couple of inches square, with a DB-15 on one
side and a Centronics SCSI plug on the other, which looks a lot like the
funny end of a printer cable). The use of an ICD Link is the only way I
can think of to "just hook a Sun SCSI drive to the back of your machine".
So, do you have anything dangling out of the back of your machine?

Open up your MegaSTE and verify that you have an ICD AdSCSI Micro internal host adaptor. Again, unless it was added later you probably don't. If you cannot tell, draw a picture of it noting placement of distinctive components (the ICD unit has a small potentiometer on it to adjust drive spinup time, and I don't think the Atari unit does) and post an ASCII version of the picture. Also, note exactly how everything is cabled in there, and describe it in detail.

It is extremely likely that this is your problem (no ICD internal unit). The newer versions of the regular ICD software will work with a non-ICD host adaptor, but the caching will be disabled. Is that what is happening with you? Is it working at all? Exactly what version of the ICD software are you using (the version number that comes up when the machine is first booted, from floppy or hard disk)? Older versions would not work at all without an ICD unit present.

If you do have an ICD Link hooked to the back of your machine, and if your internal host adaptor is an Atari unit (likely), then the problem is probably that you don't have anything plugged into the Link. It gets its power from the remote device it is hooked to, so if it is just hanging out the back of your machine it probably won't work. If this is the case, you need to hook something to it to be able to use the non Pro-level ICD software.

I am beginning to suspect that you don't have any ICD host adaptors at all, and that your ICD software is old enough such that it does not work with non-ICD stuff. The guy with the Sun drive might have had an ICD Link hooked to the end of the cable. This would explain why the ICD software worked previously. If this is the case, you should either get the Atari AHDI software or purchase the Pro Level ICD stuff (I recommend the latter). Anyway, a more detailed description is needed!

604. Re: more on UNIX gcc cross-development

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-30 07:10:57 UTC
From: dvasilef@copper.ucs.indiana.edu
Message-ID: <CKFLA9.wy@usenet.ucs.indiana.edu>
Source record: 34584
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

In my valiant attempt to build a gcc cross compiler on the DEC alpha axp 4000/384 MB here at school, I don't know if I've done anything right yet, but so far:

I got all the sources.

Got cgcc/gcc-cc1/gcc-cpp to compile with no errors.

got gcc-as to compile with no errors.

obtained the libraries in binary.

However, nothing in utlsrc37.zoo compiles for me, and when I run cgcc, I get
cgcc: Internal compiler error: program as got fatal signal 6

What do I need to do to get utlsrc37.zoo to compile? All it says is warning: redefining 'free' and then exits some time later but gives no explanation.

and what is the problem with cgcc?? Do I need to give it a command line option to look in my gcc-cross directory instead of the default dir?

thanks very much for your help.

I was afraid that would be the answer... But, I suppose I can patch my copy of
NVDI and let it go.

It seems, from various TT docs, that there is no palette change that will
invert the TT-hi video, the inverters are only present for the lower rez's.
Oh well.

What the heck, give it a try. You've got a wide variety of options; each
port has an 8 bit X and Y (paddle) input, so you could easily have 4 8-bit
inputs. Port 0 also has a light-pen input, which gives 10-bit values for X
and Y, which you could try to use for higher resolution. But, I've never
seen any docs describing how fast these ports can be sampled, or what voltage
levels they expect... The button inputs seem to be 5 volt TTL level, dunno
about the analogs...

I would not recommend the LINK at all, as its not intended for this
type of contruction, its intended for Mac/PC type external hard drive boxes
with 50 way connectors on them, its a external host adapter not a internal one.

> Scott R. Chilcote
> scotty@verdix.com - or -
> scotty%verdix.com@uunet.uu.net

All you need to do is to remove the hard drive in the box and fit a Quatum
LPS type drive, but you will have to get ICD's Pro software to make this drive
work, Supra does not support these drives..

Note: the 25 way 'D' type connector is wired the same way as Mac type drives
use, so a Mac type hard drive can connect to this 25 way connector...

Where is the problem? I've never used anything but inverse video selected
from the CPX control panel, giving me at least white characters on a black
background until I find a green phosphor CRT replacement for my PTM144.

>--

Uhhh ... one _must not_ use the STe/Falcon-analog-ports for sound-sampling
or anything else like this !!! The analog-inputs are the same than in every
old home-computer (VC-20, C-64, Atari 400/800/600XL/800XL ...) !!

That means you can only connect a paddle or a variable resistor of 500kOhm
This resistor is used to unload an internal condensator ! During the
unloading a 8-bit-counter is running, so you get a value between
0 and 255 - thats all.

You see - there are _no_ "real" ADCs in the STe ! For sound-sampling, the
Falcon has audio inputs wich are connected to "real" ADCs.

BTW: The light-pen-input is a _digital_ input. It does not produce
x/y-values ... only the video-chip writes its current row/coloumn
into the light-pen-registers, if this input becomes low (0V).

I recommend to use "real" ADCs like AD-7569 from Analog Devices. This chip
produces up to 100000 8-bit-samples per second and is very cheap.

Greetings, Arno

>Software is a joke on the ST and Falcon.

Meaningless drivel. Easy for you to trash the efforts of dozens of hard working people, but we'll just go on using the stuff and being productive regardless, eh?

>Unix programs? Where? unix doesn't even run on the ST or Falcon!

I'm talking about GCC, Make, Emacs, vi, and dozens of megabytes of similar development programs. Those who work in the Unix environment can find development on the Falcon & ST very familiar.

I think we have two different points here. You're beating the old "it isn't the 'state of the art' and never will be" drum.

I think that the majority of ST owners realize that! Just don't try to convince me that Windows is a better working environment, that Mac System 7 is faster or a joy to program for, and that either a PC or a Mac makes a worthy replacement for my Falcon.

Modest Flames:

You can nitpick away if you like, but I can bury you in stories of PC compatibility problems (I work with dozens of people who have them). I have a Mac on my desk at work, and while it is useful, I wouldn't take one home unless it was top-of-the-line.

Forgive me for wanting a little diversity in the computing world. Why the urge for the most testosterone-laden computer? I guess some of us are destined to never see the light; to go on getting productive use out of the off-the-mainstream computer, and not feel the lack.

616. Atari Megafile 44 w/ Seagate ST-157N weirdness

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-31 01:30:42 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <2ihn02INN12sn@rs1.rrz.Uni-Koeln.DE>
Source record: 34599

Hello hardware gurus,

I have an Atari Megafile 44 (Syquest removable HD drive) here, which has a Seagate ST-157N built into it. It works without any problem on my 520 STm (w/ 4 MB) and with my TT. However, it does not work with my friend's Mega ST 2 (w/ 4 MB). My 520 ST boots from the Seagate hard disk, but when whe try my friend's Mega ST, the orange LED on the Syquest comes on and remains so, and the computer does not boot unless it is given a floppy, which then works. When we try the harddisk driver installation program, it finds no ACSI devices. The orange activity LED of the HD comes on for a few seconds while the program checks for connected ACSI devices, but neither the Seagate nor the Syquest is found. The Mega ST works with other HDs, though, as we have checked, so the problem seems to be with the particular combination of this Mega ST with the Megafile 44, no device fails consistantly.
I opened up the Megafile 44, and found that both the Syquest drive and the Seagate HD are equipped with SCSI terminator resistor arrays. The host adapter is labelled "ST TO SCSI ADAPTOR, C103310, REV. 2". It also has some resistor arrays on it, but none of them look like SCSI terminators (as judged from their grouping on the board).
Based on the idea that the problem may be caused by too many active terminators on the SCSI bus, I tried booting the system with the hard disk or with the Syquest drive disconnected. Neither of these worked.
Unfortunately, we have no manuals for the Megafile 44. I bought it as a part of a used system, and the previous owner fitted the Seagate HD into the Megafile case. Currently, I'm looking for answers to the following questions:
1. There are 3 dip switches underneath the Megafile, can anyone tell me what I can set with them? The current setting is 010.
2. There are 5 pairs of pins for jumpers at the rear side of the Seagate hard disk, does anybody have info on these?
3. There are 7 such pairs of pins at the rear side of the Syquest drive, any info on them?
4. There are two 25 x 2 groups of pins on the host adapter for connecting SCSI devices. The hard disk is connected to the pin group next to the front of the case, the Syquest is connected to the group next to the backside of the case. How do I figure out which device is the last one in the chain, and hence needs termination?

Thanx in advance for any help, which I would very much appreciate.

>The writer then went on to say how wonderful GEM Bench is!

Here's an interesting point about GEM Bench:

The test for "blitting" appears to be done using a blit from RAM to the
screen. However, many (most?) of the real-world uses for blitting are
screen-to-screen.

So, while the "blitting" speed of the NOVAplus card is shown as "33%",
moving a window on the screen is practically instantaneous.

>Up until now I have only wanted to get single mouse clicks (clicks = 1).
>Now I wish to have a single evnt_button that informs me if a single OR a
>double click took place.

The "clicks" parameter specifies the MAXIMUM number of clicks to wait for.
So setting it to "2" gives single and double clicks.

Personally, I think the whole idea of double-click timing handled by the
OS is fundamentally flawed, but nobody will believe me.

>I know that you
>can't sdet up evnt_button to handle the right or the left button (just
>both at the same time)...

Oh yes you can. What is it again? Add 256 to clicks and set state=0,
buttons=3? (read "NOT(both buttons up)"). That's the trouble (?!!)
with libraries - you do things once, then forget about it.

I finally started cleaning my basement (those that know me know this is a miricle..) and came accross something interesting (besides I love Atari bumper stickers and Pins...) and I have no idea what it is. Its called a XEP80. On the back it has a 1'8" headphone plug, which is the power I assume. 25pin female plug an RCA plug and an empty hole.. On the inside the two Atari chips are copyright 1987..

Thanx... I found this right next a 10meg HDD thats as big as a table (and weighs twice as much!!, then there's the 20meg thats twice the size of my printer.... and other classic computer stuff...

622. Ultrascript, PS35 Font Set & PageStream 2.2b

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-31 08:57:31 UTC
From: "Dom Alvear"
Message-ID: <2iih5r$fb3@news.delphi.com>
Source record: 34612
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy!

I just purchased a used copy of Ultrascript ST-1. It came with the Times, Helvetica, Courier font disk as well.

The purpose of this message is two-fold. First, I was wondering if somebody out there might have the remaining font disks to complete the PS35 set. And if so, would they be willing to sell me those disks?

Second, and more importantly, I am looking for any hints and tips for using Ultrascript with PageStream 2.2b. I already have the PS35 screen fonts, so unless I can use the Ultrascript PS fonts (which I don't know if I can), I just need to know how to get Ultrascript and PageStream to work together to print PS documents on my Okidata OL400.

Thanks in advance,

Dom

P.S. E-mail responses would be best as they are easier to collect.

>So, while the "blitting" speed of the NOVAplus card is shown as "33%",
>moving a window on the screen is practically instantaneous.

Correct. For screen to screen blitting look at the VDI scroll test
instead.
The blitting test stores the image in the computer RAM and then blits it
back to screen so you are measuring both system and VRAM access.
The VDI Scroll test uses vro_cpyfm to scroll and then draws the bottom line
using v_gtext. This test is probably more representative of a real world
situation. However, I believe that icons and images in a RSC file are
blitted to screen using RAM-to-screen method. Same applies to some progdef
that are used in modern flydials, etc.

Message-ID: <2iisap$iks@cismsun.univ-lyon1.fr>
Source record: 34596
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi everybody...

I'm trying to compile a Compiler Compiler on my Atari Mega STE 4/100 with
or without MultiTos. I tried both using PureC and Gnu GCC. With Pure C,
it compiles and links very well.
When I execute it and I try to compile a grammar, It parses and analyses the
text, then gives 2 bombs.
I traced it using Pure Debugger, and it happens that after performing (viva
Cobol ;-) about 200 mallocs (building trees) one malloc returns NULL, the
programm prints an error, continues, redirect on this pointer and hangs...
I didn't calculate the amount of memory allocated, but friends of mine
compiled it and had it running on a PC using less than 600 Kb (plain DOS).
I tried running it with 3.5 Meg available, but no avail...

=> My question:
What is the blocking factor of the malloc function provided in the PCSTDLIB.LIB
library ? Is it possible to change it ?
(I know that this programm do a LOT of SMALL mallocs (tens of bytes, or less)..
It's possible that because of the malloc blocking factor, each time I allocate
a few bytes, it allocates much more, and the program fills the memory...)

Is it a maximum number of mallocs allowed by the library routines, or a maximum
of Malloc allowed by the TOS (i.e, the Other, low level malloc) ?

Thank you for your help...

It is a write-through cache. If you want to have a write-back cache,
you should try MinixFS for MiNT (it's really *fast* in turbo mode).

Aha! That's how Atari was able to make computers for so little money...they saved it on the solder!

I had a similar problem to the power supply thread that's going on right now, but with the joystick port. It seems that Atari really skimped in the quality control area on the STE's (I've got a 1040 by the way).

>sampling? I wonder...
>
>They're probably pretty cheap/cheesy ADCs, but they'd probably work...

Disclaimer: I don't know for sure that this is correct. However, if the STE is like every other micro with paddle inputs, then...

I don't think there are any ADCs on the paddle ports. Most paddle inputs are actually constructed out of an 8-bit counter, a latch and a capacitor.

To read the input value, the counter is initialised to zero and the capacitor charged [or discharged]. The resistor in the paddle is then used to discharge [or charge] the capacitor, while the counter runs. When the charge in the capacitor reaches some preset value, the output of the counter is latched -- this is the value that appears in the paddle register.

Paddles were originally done this way because ADCs were expensive, whereas counters and latches are cheap. With more, cheaper ADCs on the market, I wonder if that's still true.

Hope this helps,

Mat

Sounds like you've hit the (in)famous "40-folder" bug. This bug
appears when you've accessed at least 40 folders during your session
(if I remember right, this doesn't have to be 40 different folders,
just 40 times moving in and out of folders). I think the bug
has something to do with the allocation of buffer space when changing
directories (?). FoldrXXX (Foldr100, or how many folders you allot)
kind of compensates for this bug (doesn't get rid of it, but helps
avoid it). Look for FOLDR100.LZH or FOLDRXXX.LZH at your
friendly neighborhood FTP site :-)

On the Falcon (and TOS versions above 1.2?) this bug is an annoyance,
like what happened to you. On TOS 1.0 (and maybe 1.2) this bug had
the knack of possible corrupting the disk. In either case, get a
copy of Foldrxxx, throw it in your AUTO folder, and forget about it...

Rob

...if it wasn't included with the Falcon, FOLDRXXX should have been
included with *every* system Atari sells, but who knows?...

A friend of mine had a problem like this a couple of years back. We found it was a Solder pad on the power supply PCB, had cracked right around the pin and so the weight of the transformer bent the board and lifted the pad away, so diconecting the power.

All that was needed was just to reheat the pad with a Soldering iron and it was as good as new.

Who can tell me how to acces directly the IDE and SCSI chips on
falcon ?

639. GEM queries

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-31 18:00:52 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2ijh0k$8vv@bambam.cs.city.ac.uk>
Source record: 34628

I have some more VDI/AES queries/observations:

(1) When you open a virtual workstation should work_in[] be 11 or 12 words long? The Compute books use 12, the Atari Compedium uses 11.

(2) It is recommended (in many refs) that multiple virtual workstations be used to efficiently manage attributes. This works fine for my current app since it's written in a modular fashion and each module has its own initialization code that opens its own private virtual workstation with its preferred attributes. Whats worrying me is that as the size of the app grows I'm opening an awful lot of virtual workstations. Is there a limit? how many is it reasonable for an app to use (a) on a bog standard ST; (b) on a falcon with multitos.

(3) I notice that AES does not respect the full size of the windows; ie I create a window with a full size of less the the current desk top but AES will happily let the user resize it to greater than my specified full size.

(4) Object trees do not separate the graphics information from the actual data displayed in the objects. This leads to the following problem. Suppose I have an editor form, that I display in an editor window. And suppose I let the user open multiple editor windows. Then it seems there are two choices: (a) Share the one object tree between the several windows; this means before each redraw I have to write the appropriate data in to the object tree. (b) Make copies of the object tree as required. Only those parts that contain data or pointers (to parts that contain pointers to...) to parts that contain data need be copied. Static bitmaps for example can be shared. Any better solutions?

(5) I notice that AES makes a lousy job of fixing up resources for different resolutions. In particular objects that are not on character boundries end up in the wrong place. I understand why this is (.rsc files use a #char+#pixels representation and pixels aren't scaled); but is there a good solution?

Steven

Source record: 34610

I did not get it with my machine either. I thought that Atari had solved
that little bug a long time ago. Oh well, better go get foldrxxx :(

This sort of thing really should be supplied/fixed. Instead we get SAM
and AFM.

What a waste of resources, and how come US falcon owners get Atari Works!!

I would like to see just how good Works is but unless Atari supply it to
us Falcon owner free of charge like MTOS...

M.May (about to add yet another patch program to his auto folder)

641. 19200 baud glitches on Atari ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-31 18:38:12 UTC
From: hurley@robadome.com
Message-ID: <2ijj6k$dlr@mack.eng.sc.rolm.com>
Source record: 34630

I just tried out a high speed connection for the first this weekend
and found that I was getting a few garbage characters every now and
then - typically when listing large files. I was using Flash 1.6 at
19200 and a SupraFax modem to a netcom.com host. My Atari ST has
ADSpeed running at 16MHz.

I have SERFIX2.0 installed. I can't recall all my Flash cnfg settings
at the moment.

I was quite pleased to see 1850 cps Zmodem file transfers (no problems
there).

Is this typical of an Atari ST at 16MHz or should I look into
this problem some more?

90% if you consider that anything that (legally) scrolls in a GEM
environment does so using vro_cpyfm - with the possible exception of
scroll boxes in dialogs which are often done by changign text pointers,
etc.

AES and the TOS programs are competing for keyboard input.

644. More Lattice 5.6 problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-01-31 21:13:25 UTC
From: hrs@aber.ac.uk
Message-ID: <1994Jan31.211325.27777@aber.ac.uk>
Source record: 34613

Anybody tried compiling the following using the latest upgrade to the Lattice
C compiler (5.6):

```
#include <aes.h>

int main()
{
appl_init ();
appl_exit();
return 0;
}
----------------------------------------
```

When I compile this as a gem program and try and run it I get the following
dialog box:

Illegal AES function call

and them booooooom..

I came across it while recompiling my gem programs using the upgrade.
So now I don't have any of my gem programs in working order (bloody hell!!).
I'm going to have to junk 5.6 and reinstall 5.51, which does work. Have
Hisoft really screwed up this? Anybody else had problems like this?

> at the moment.

If you insist on using Flash, be sure to lock RTS/CTS flow control on with the serfix2 CPX. By default, Flash does not allow you to select this type of flow control. Flash is really a bit old and pokey for high speed stuff (it can be made to work, but there is better stuff out there). You should give Connect and STorm a try. STorm was written by the same guy that did Flash. Also, be sure to check out GEM RZSZ 2.28. It is the best external Zmodem out there (in the pd/shareware domain) IMHO.

I was plagued with character dropping until I tweaked my auto folder configuration. It turns out that having too many interrupt tied TSR type utilities was causing my problem. If you use Mouse Doubler or Click (the former a mouse accelerator, the latter allows you to tie digital samples to individual keypresses), try getting rid of them (that did it for me, but I am running an 8mHz machine). Paring down the auto folder in general is a good strategy to attempt.

I'm not sure if HSMODEM (latest version available with Connect and from atari.archive.umich.edu) can also lock RTS/CTS on with Flash. If it can, it will give you better performance than Serial Fix 2.x. In fact, there is a special driver module specifically for 16mHz machines that you can add for more performance. I have heard that there is a patch for Flash that locks RTS/CTS in the binary itself. If you can find it, you could use any serial accelerator package you desire.

> I was quite pleased to see 1850 cps Zmodem file transfers (no problems
> there).

Man, I'm psyched for my MegaSTE (recently ordered, not here yet). I average 1600-1650cps with my Mega2ST (box stock, with HSMODEM and Connect).

> Is this typical of an Atari ST at 16MHz or should I look into
> this problem some more?

It seems that most folks don't have such problems, as I did not encounter many respondants to my posts when I had the problem. Good for them, but it took me a long time to fix the !&@*#$% thing <grin>.

BTW, there was a recently posted file called 38000.lzh that details an
easy hardware mod for regular STs that will give you 38,600 baud capability.
You might want to consider it.

649. Updating gdb for Ataris?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-01 05:32:28 UTC
From: saj@chinet.chinet.com
Message-ID: <CKJ625.EFL@chinet.chinet.com>
Source record: 34626

As I look at the gdb manual, it looks very attractive. Unfortunately, I can't get it to work on anything at all on my Falcon030. The manual suggests that by using the BFD library it should be possible to accomodate any style of object or executable file. I can't be the only one nuts enough to be tempted to pitch in and try it. I have about 4 other things to do which really ought to come first. Why would I be wasting my time trying to get gdb to work for GNU compilers and Lattice C (at least) on the Falcon?

>(1) When you open a virtual workstation should work_in[] be 11 or 12 words
>long? The Compute books use 12, the Atari Compedium uses 11.

As another data point, the Profibuch specifies 11. Does the
Compute book give any info about the meaning of work_in[11]?
Perhaps it's used for turning off some known and unknown VDI
bugs? ;-)

>(2) It is recommended (in many refs) that multiple virtual workstations

>(b) on a falcon with multitos.

Hmm... I recall reading something about limitations on this
issue, but can't find it in the Profibuch right now. Perhaps
there was something in the readme file accompanying VDIFIX?

>(3) I notice that AES does not respect the full size of the windows; ie I
>create a window with a full size of less the the current desk top but
>AES will happily let the user resize it to greater than my specified full
>size.

I have never observed the full size parameters (specified at
wind_create()) to have any effect other than setting the values
returned by wind_get(w, WF_FULLXYWH,...). Not with TOS 1.02,
1.04, 2.06, 3.06 and MultiTOS. Seems like your choices amount to
either creating and handling your own window control elements, or
applying size constraints after each WM_SIZED message. I've
settled for the latter, as this is the place to apply any
snapping anyway.

>(4) Object trees do not separate the graphics information from the actual

>Any better solutions?

Can't think of any. I don't consider this to be a flaw of the
object trees as such, though, I think the problem is that the RCS
doesn't offer any way to create resources with multiple links to
shared objects. The object structures use pretty convoluted paths
through pointers to access data, so there would be ample chance
to have several of these point to the same, shared object, but
I've never found a way of creating such a resource (other than
doing that "by hand").

>(5) I notice that AES makes a lousy job of fixing up resources for different

Warwick Allison has observed that too, and even posted a proposal
how to handle the fixing better a while ago. I think his GEM++
library uses custom routines to do this job.

Hello people,

May I ask if there is a Freeware Oberon-Compiler available for the Atari-ST,
or otherwise source code in Modula-2 for a Oberon-Compiler that produces M68k
code?
If you know anything, please let me know!

please mail to:

eglis@urz.unibas.ch

thanks beforehand for all replies! Simon Egli

656. makeing Mint 1.08

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-01 14:33:07 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2ilp73$u0@nutmeg.csv.warwick.ac.uk>
Source record: 34635

Hi,

I have just successfully compiled Mint 1.08 with -DMULTITOS, but
at the end of the makefile, there is a reference to a program
called 'prgflags':
prgflags 7 7 mint.prg

I haven't got this, so I'd like to know what it does and if it is
essential. Also, is it possible to have the features of Multitos 1.08
i.e iconification of windows, or do I need a new GEM.SYS from Atari.
If this is the case, I'm out of luck, because they said 1.08 is not
available to the public.

I know there was a recent thread on this topic, but it wasn't relevant to
me at the time :-), sorry if my questions have been asked (and
answered) before.

Thanks,
Paul Donovan

Hi,
I'm lookig for certain items for TT

software:
virtual memory expansion for normal TOS. I think it is called
VRAM and I remember hearing that from version 2.0 onward it
doesn't require any TT-(fast)-RAM in order to work...so fits
in to any TT....

any info on this one or a similar sollution ? (where&how_much)

hardware:
what are my choices in graphick cards for TT
-which have the most drivers ie. which works with most programs

what are my choices for TT-FAST-RAM expansion (got currently 4mb
of TT-ram on ATARI varsion 1 mem.board with 1mb _simms_ and
three jumpers)... prices ?

is there a single monitor that could display all TT-resolutions
(and st-resolutions in TT where their frequenzy has been altered
from original ST hz...)

and I just hate to go through all that ST-crap in thsi group to get the
answers so, please reply by e-mail... or answer through a
comp.sys.atari.tt if they finally make one !!!

chiao ! Markku

>wanted to let readers know that it shouldn't be taken too seriously.

I didn't read Ofir's article, but I do think the distinction between the
different types of benchmark ought to be considered.

There are basically three types of benchmark: Test, Synthesis and
Application. Test benchmarks are where you exercise well defined features
of a system. They have the disadvantage that you assume the tests are
relevant, and you can't measure the performance change when the features
interact with each other. GemBench is a test benchmark.

Synthetic benchmarks are programs synthesised somehow from data collected on
actual programs. Whetstone, Dhrystone, Hartstone etc. etc. are examples of
synthetic benchmarks. Synthetic benchmarks have the disadvantage in that
they are only as good as the original data and the skill of the benchmark
constructor.

Application benchmarks measure performance of a "real world" application
that is considered to be representative of some class of applications that
you're interested in. The problem with application benchmarks is that you
assume the program is relevant, and you often don't know what it's doing.

From what I've seen, GemBench seems to be performing the right sort of
tests. It is therefore a good way of comparing Atari systems (you keep the
program the same and vary the system only).

>>Such benchmarks can always be used to mislead people (See Systems Solutions
>>misuse of your own program in their T28/T36 ads, for example; they do not

All benchmarks can be misused, and some forms of benchmark are more useful
than others (e.g. Dhrystone is a poor synthetic benchmark, we've known it
for years, the author even wrote a paper on its defects).

This really ought to be covered *in detail* in the FAQ:

The "40 folder" bug is only "40 folder" on TOSes before 1.4. An area of OS memory called the "pool" is used to keep track of active folders *AND* allocated memory.

Before TOS 1.4, an "active" folder meant one that had been "seen" by the user. With later TOSes a folder is only active if

a) It's the root directory of a device
b) It contains a file that is open
c) It is some process' current working directory

You can still run out of OS pool memory -- open lots of files, malloc lots of memory blocks etc. The OS can't expand the memory pool dynamically (it can't call malloc(), remember -- it *is* malloc()! If we had something like Unix morecore(), virtual memory etc. then it would be able to, but I digress)

If you hit the limit in your program, check to see how often it calls malloc(). If the answer is "lots", then consider implementing your own memory manager that calls TOS for large chunks of memory as and when required.

663. Virtual Memory on Falcon030

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-01 17:28:28 UTC
From: I.M.Rae-SE1@cs.bham.ac.uk
Message-ID: <1994Feb1.172535@cs.bham.ac.uk>
Source record: 34643

I know that there are a few virtual memory proggies for the TT and Falcon (Outside and VRAM030 ?) but what I would like to know is do have to be running MultiTOS to use them ? If this is the case then it's a real shame cos MultiTOS really is horrid (too slow... unreliable...). Could I just get by with using MiNT if the virtual memory program needed that kinda stuff ?

Many thanks...

Ian Rae | Current project-DSP Sound effects...

Neither OUTSIDE nor VRAM require the use of MultiTOS (*cringe*), but as much
as I know they work with it..i.e. I know for certain OUTSIDE runs with Multitos
but does NOT require it as such.

Cheers

>I have just successfully compiled Mint 1.08 with -DMULTITOS, but
>at the end of the makefile, there is a reference to a program
>called 'prgflags':
> prgflags 7 7 mint.prg

>I haven't got this, so I'd like to know what it does and if it is
>essential. Also, is it possible to have the features of Multitos 1.08

I also just upgraded my MultiTOS 1.04, to 1.09 and had the same problem
after linking. I just guessed that it's one of eric's own utilities
to set the 'executable' bits in the file mode. I just used:
chmod 755 mint.prg

I've been running 1.09 for a few days now with no problems whatsover
so I suppose my 'guess' was right.

As for the Gem Icons, you probably need the latest GEM.SYS. I only
occasionally use the GEM.SYS supplied when I bought MultiTOS because
it swallows too much memory, so I don't recall if it iconifies windows
or not. Correct me if I'm wrong, but GEM is _not_ public domain, like
MiNT, so you would have to buy the latest version from Atari. :-(

Cheers, Steve

This will probably start that boring discussion again .. but ..

It's not a bug ... it's a limitation, most users won't hit the roof, and those who do are given the possibility of increasing the memorypool - thus avoiding it.

In TOS 1.0 it was a bug, (maybe in 1.2 too?) .. after that it's not ..

Oh, I don't use any FOLDRxxx.PRG on my Falcon .. I don't increase the pool at all .. ONE program has failed so far, and that's Brainstorm's old VIEWER00.PRG ..

Obviously the limit is 32767. Most configurations will run out of memory
long before that limit has been reached. Anyway, don't forget that other
applications will be opening virtual workstations too.

Interesting - I do actually have two minix FS partitions, and just
recently got the newest version (pl9?) of MFS, after I compiled MiNT
1.09.

Is there any advantage then to using a cache program like this for the
Minix partitions?

Bizzare?!? Have you checked for viruses? I have heard that link viruses
that can affect a hard disk do exist for the ST. Do you have any patching
programs in your auto folder? Do you have your software configured to
use write caching (if so, you might want to disable this until you solve the
problem)? Do you reformat the drive each time after a crash? What do you
do to invoke the problem, or is it purely a time thing? How many extra
folders are you allocating in your ICD software (see hdutil.prg)?

OK, I got some really good responses about using evnt_button(2, 1, 1, ...

to get a single or a double click. I tried it out and it works fine.

Now I want to use it within evnt_multi, but I can not seem to be able to
get evnt_mult to give me an indication of weither a single click or a
double click occured. In my program, I am doing the following:

```
int selection;

selection = evnt_multu((MU_KEYBD|MU_MESAG|MU_BUTTON), 2,1,1,.....
```

then I'll display the value of selection. No matter what I do, if I
single click or I double click I get a value of 2 back.

Replace your DMA Chip..

The ones that don't work are C025913-38..

The newer ones are C398739-001A..

I have had this problem happen twice with my hard drives, the only way is to reformat..

The DMA Bug shifts data to the left by 2 bytes on all write access, Dirs/Files and Fats, is gets very messy to fix up..

Hi,

here in Japan there are no Falcon-approved SCSI 2 HDD's.

Instead they have the following SCSI 2 HDD categories:
for:

DOS/V
MAC
Japanese MS/DOS clones
UNIX workstations

Which one do I need?

Any help much appreciated,

Christian

Allanon (mm68@unix.brighton.ac.uk) wrote:
> I did not get it with my machine either. I thought that Atari had solved
> that little bug a long time ago.

It's not a bug, it's a feature! There are system limits for the number
of Malloc() calls per process and for the number of open files and
other stuff. These are documented in the TOS 1.04 release notes.
The limit is configurable using FOLDRxxx. This is comparable to
the FILES=xxx option in DOS. The reason why many people think this
is a bug is the fact that before TOS 1.04 there were situations
where even an infinite "folder buffer" wouldn't be sufficient.
These problems have been fixed, but if your program calls Malloc()
a lot or holds many open files in many different, deep directory
structures, you may have to reconfigure the OS using FOLDRxxx.
Of course, a better fix would be to revise your program and call
the C library's malloc() instead of Malloc(), for instance.

[...]

The program above compiles and runs fine for me. Which options do you have
set? I tried with my usual options, plus no options set and no options
except default short ints (-w), and all work fine.

I _did_, however, get the 'Illegal AES function' dialogue (and bombs)
when recompiling a big multi-module program with LC 5.60 (which had worked
fine with LC 5.52).
Strangely, running the resulting program from the desktop worked OK, but
running from the integrated editor or from MON inside the editor caused the bug.
I fixed the bug by making sure that all the modules were recompiled with 5.60
I haven't had any problems since, except for the Options:Compiler menu
bug, which has caused me to loose work a few times :(
I may go back to 5.52's Editor, since it seems to work OK with the new
compiler, and doesn't have the bug.

This is supposed to set the program flags, so that MiNT is loaded into TT ram and malloc's from TT ram. If you have toglclr from the GCC utilities you can use this instead. I'm not sure about the correct switches, should be something like

toglclr -fload -frun -fmem mint.prg

Just run it without parameters and look at the usage message.

You can get gdb 3.6 for MiNT from
ftp.germany.eu.net:pub/comp/atari-st/mint/gdb36p4[bs].zoo
(b = binaries, s = sources)

Not that 3.6 is not the latest version of gdb, but porting BFD to the
atari isn't trivial (a slight understatement :-/)

Well, the install program is notorious for not copying some files
across, so are you sure you are using all the headers and libraries
from 5.6? Where does the dialog box come from, BTW?

I've had no problems wih GEM and 5.6...

You don't need to be running anything other than Outside or Vram.
The only caveat is that the programs you want to run have to be able to
use TT ram, because the space you get on disk looks like TT ram to programs.

Once again, you don't need MiNT, let alone Multitos. However, VM comes in
very handy when you are using MultiTos.

Pedantry time, perhaps, but it might stop some people getting confused:
Don't you mean Malloc? malloc is a C library function and has nothing
to do with the operating system. Malloc is the OS call to get memory.
A typical malloc implementation will call Malloc from time-to-time, of
course, but not on every malloc call.

If you run Mupfel as a TOS program, it isn't possible to start a GEM
program. TOS programs can't do that at all.

If you want to start a GEM-program from Mupfel, use Mupfel in the
Console Window (e.g. start Mupfel with ALT-M from the Gemini-Desktop)

WHat *is* the limit to mallocing on STs? I'm a little way into writing a small utility which would as part of it's functions have a mini word-processor. I was going to use a linked list for the lines and malloc for each new line. it sounds like this would be doomed to fail as a strategy.

702. VDI problem : vro_cpyfm()

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-02 16:59:12 UTC
From: jpp-a@minster.york.ac.uk
Message-ID: <760208351.7393@minster.york.ac.uk>
Source record: 34680

I am having problems getting vro_cpyfm() to work
correctly.
I'm using Megamax C and need to perform a fast scolling
system for windows by blitting the non-changing portion
of a screen, and filling in the rest.
The fill-in works fine, but the rest of the window blanks
out when the vro_cpyfm() is called - it would appear that
it is in replace mode, using a blank area of memory as the
source.

The MFDB's in use are identical, and are set as follows -

```
address=0L;
width=640;
height=400;
wdwidth=40;
stand=0;
nplanes=1;
```

and the call is made -

```
vro_cpyfm(handle,3,pxyarray,&src,&src);
```

where handle is the workstaion handle, 3=REPLACE mode, pxyarray
is an array if ints specifying co-ordinates, and &src is the
address of an MFDB, whose declaration was made : MFDB src;

Any help or advice greatly appreciated,

Jason.

> work.

Uh, many MSA files are in two parts _for one disk_!!! This is to keep the
size of the files down to something a PC floppy disk can handle (under 720k).
Many demo disks use an extended format (most of which MSA can handle just
fine, BTW) and end up being over 800k. Splitting the files makes life easier
for those that use PC formatted disks to transfer files around.

As an example, for many demos that come in two parts, the first file contains
tracks 1-41, and the second contains tracks 42-82. Thus, you restore _both_
MSA files to the same floppy disk to recreate the original.

So, go and get a copy of MSA 2.3+ from atari.archive, and look a the file
information when you use it (there is an "info" button)! If the file only
contains part of a disk, obviously one needs to restore more than one file
to rebuild the disk.

I'd bet that most of your failures have to do with this phenomena. It
sounds like your working Chaos disk did so only by pure luck (i.e. it did
not care about accessing anything past the first 40 tracks or so, or at least
did not die from it).

> As a general consensus, and not to discredit its programmer, would it be
> possible to convert all of the MSA programs to other, more stable archive

> willing to try to see which ones work. It just riles me a little when I
> download a file from the archive, then download it overnight onto my system and
> then not have it work...

MSA is perfectly stable, given that your floppy drive can handle up to
82 tracks, 10 sec/track!! Even the older versions worked fine on my
box-stock Mega2ST. Get a copy of DC Maxtracks and find out if your floppy
is one of those that barfs on anything over 80 tracks (it is also available

from atari.archive). If so, look into having it swapped out for one that can handle extended formats.

It sounds to me like your problem is one of misunderstanding. MSA is a format that requires a bit of understanding concerning technical information about floppy disks (i.e. what constitutes an extended format, what constitutes a partial disk, etc.). So, here is the scoop.

A "regular" DSDD floppy disk on an ST is formatted 80 tracks, 9 sectors per track. Anything above this (for either numbers) is an extended format. A very common one is 82 tracks, 10 sectors per track, which virtually every ST/TT can handle (you might be one of the unlucky few, DC Maxtracks can tell you this). In addition, there are also special methods of formatting (independent of the number of tracks or sec/track). A very common one is "twisted" or "skewed" formatting. This method orders the sectors in such a way as to double the speed of reads and writes! I use 82/10 Twisted disks almost exclusively on my ST, except when I need DOS compatibility (for that I use ps2form.tos, again from atari.archive).

MSA is a program that allows one to transfer an entire diskette in a single file. It analyzes the floppy to figure out the format, and writes this information, the boot sector (which may contain code to enable the disk to boot and execute without an auto folder, or even any "files" as you normally think of them), and the data from each sector on the disk to a file. You can tell it to do only part of the disk, and it handles it just fine.

MSA was not intended for piracy per say, though it is often used to transfer "cracked" game disks. The "cracking" of the disk involves getting rid of various copy protection routines such that the disk can be duplicated by something simple like MSA. In general, even trivial copy protection will defeat MSA. So, MSA is not a pirate copy program, and was not intended for piracy (I had an email conversation with the original author some years ago). It simply makes it easy to transfer self-booting disks around.

Hope this helps.

>recently got the newest version (pl9?) of MFS, after I compiled MiNT
>1.09.

>Is there any advantage then to using a cache program like this for the
>Minix partitions?

I think you misunderstood the MinixFs bit. Minixfs already has a fast write-back cache, so adding a program that hooks into the rwabs vector is likely to slow disk accesses down due to the double buffering. Plus the fact that your data will take longer to reach the disk! When using the ICD drivers, minixfs disables ICD's write-back cache on minix partitions on the fly regardless of how you configure ICDBOOT.SYS using hdutl.prg.

- Just my ha'penny's worth! ;-)

Cheers, Steve

: situations" is 72%.

well, one thing I've come around this weekend is a test in a 1986 issue of "mc"
a German magazine. They have compared a *fast* 13 MHz 286 with a ST and an INMOS
Transputer. The result has been very poor for the ATARI. But wait, they used the
Megamax C-Compiler. So I typed the program in and compiled it with Pure C. The
difference is 55 seconds (Megamax) to 20 seconds (Mega ST).
Since you all used the same compiler there has to be a different reason.

One thing about the dhrystone: It uses mainly the instructions RISC systems are
designed for so the ARM gets these very high ratings. There are other benchmarks
that use floating-points and the math-library, a computer equipped with a FPU will
win on this test. For example there has been a demo on the last CeBit where a
falcon has outrun an Alpha PC with fractals because the programmers used the
fixed-points on the DSP.
These benchmarks don't tell the truth!
More important is, if you have to wait for a redraw of the screen or not. The
time you need to compile a program - or whatever you do with your computer - is
more relevant than comparing the times your computer needs to shuffle the towers
of hanoi. You will have to compare the applications! Is your word processor as
fast in searching and replacing as the others or faster? How long does it take
to print 10 pages?

I fear this posting is not that helping on benchmarks though it may help well
on comparing computers.

Bye,
Stephan Gross (1gross@rzdspc5.informatik.uni-hamburg.de)

: Result: The Dhrystone benchmarks aren't Cache-friendly (they don't seem to
: fit in the F030-Caches). As the F030 only has a 16 bit data-path to the
: memory, the results of the benchmarks turn out bad.

Um, that might cause you some problems... gcc 2.5.x can't build usable
68000 binaries. It's fine if you've got a TT or Falcon, but if you plan
to use it on a ST, or distribute it...

I'm currently searching for gcc 2.4.x sources, but I haven't had much
luck so far... so I'm not even at the stage of trying to get a
cross-compiler built.

>Hello everybody !!

>I want to know how to connect an IDE Hard Disk Drive on
>a STF?

>Is it possible ? If so what do I need ? (Board, cables ....)

>Thanx in advance.

You get a small IDE-Adapter-Board (without the chips) from eMedia GmbH 30601 Hannover, Germany (fax: (0511) 53 52 147) for 26 DM. You need also the GAL (19 DM) , a copy of the report how to make the board and how to install it (5 DM) and all the electronical parts. You also can install TOS 2.06 in this board. TOS 2.06 is needed if you want boot from the HD.
I installed this IDE-Adapter in my 1040STF and it works fine. The only problem was, that there is to less space for the board in the 1040STF, because of the floppy-disk-drive. Instead of removing the 68K-CPU, I soldered short cables (3 cm length) directly on the pins of the CPU. The other ends I soldered into the IDE-Adapter-Board. This way I can move the board around and am able to install the Floppy-Disk-Drive. The only backtrack is, that I couldn't install the keyboard in a proper way and so I couldn't close the housing. I installed some plastic pieces to fix the keyboard. The advantage of the improvised installation of the keyboard is, that I could put my 105MB 3.5"-Quantum HD into the ST1040 housing (between the power-supply and the Floppy-Disk-Drive). I didn't install the upper part of the housing. This makes cooling of the power-supply better. The power for the HD I took from the cables, that support the Floppy-Disk_driver with current.

Hope I helped you.

Andy

The standard TOS (and MSDOS) date format uses 7 bits for the year,
with 1980 as the epoch, so it should be sufficient until 2107, or
until 2043 if we strip off the sign bit. The Unix format, when using
32 bits for time+date, overflows into the sign bit in the year 2037.

>If you run Mupfel as a TOS program, it isn't possible to start a GEM
>program. TOS programs can't do that at all.

Of course, but I also renamed mupfel.ttp to mupfel.prg and mupfel.app,
same result -- I wasn't able to start a GEM program from mupfel.

>If you want to start a GEM-program from Mupfel, use Mupfel in the
>Console Window (e.g. start Mupfel with ALT-M from the Gemini-Desktop)

That's exactly what I DON'T want to do. I don't want do use the
GEMINI-desktop, I rather use the good ol' ATARI-desktop. There was no
problem with the last version of mupfel I had used. Started it from the
ATARI-desktop and was able to start any GEM program from it.

Hope anyone has a solution to this. I really like the idea of having
a working version of a decent (i.e., a Bourne shell like) shell on my
system.

716. HELP: HD formatting

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-03 11:08:59 UTC
From: black@hacktic.nl
Message-ID: <2iqm0pINNn2n@xs4all.hacktic.nl>
Source record: 34499

Ok, first my HD was formatted using some ICD utility. But since "The Link" I got with my STE requires a remote SCSI device which I don't own and don't plan to own, I recently "tried" to reformat my internal HD using the Advanced HD Utils from Atari. Problems, problems, problems. When I bought this STE the guy warned me the last partition contained lots of bad sectors due to a little incident involving hitting the table the STE was standing on. So when I formatted the HD I got over 6000 bad sectors. When HDX is done it tells me "Cannot write Bad Sector List to the disk! Try backing up the disk and reformatting it." which is nice but it tells me this when I try to format the disk!

Can someone please help me!!!! I tried using HDX version 3.5 (came with the machine), 5.0 and 5.04 (which gives me a weird errormessage about checking the connections).

Aaaaarrrrgh (Ehm, my setup: MEGA 4/STE with internal 50MB HD)

Note that there are at least two commercial solutions (the card from Hard & Soft,
or 'Ideal') which come with officially licensed TOS ROMs and driver software
with more than AHDI's IDE support (master/slave comes to mind).

When using STalker with a Falcon, you need to make sure that it is set to
TT/MSTe Modem 2 Port under the communication port entry in the settings menu.
I hadn't tried it to know for sure if this would affect DTR, but I know if it
isn't set this way DCD isn't set correctly.

If I recall, "prgflags" is part of the Atari Developers kit, so
I doubt we'll see it any time soon. My MiNT 1.09 works fine without
it as well (didn't do a chmod either)...

>Correct me if I'm wrong, but GEM is _not_ public domain, like
>MiNT, so you would have to buy the latest version from Atari. :-(

Either GEM and/or TOS was licensed from Digital, so at least one of
them is not publically available...

VIDEOTEXT pages are text pages sent with the TV programs. Some TV sets can
decode and display them. I don't know if there is TV channels using that
system in UK but there's some in France, Switzerland and germany.

This program, with a specific harware can decode them.

This is currently still true due to having to keep MiNT able to run on a
68000 without a great slowdown caused by shadowing the processes, as Minix
does.

If MiNT were allowed to develop just for the 68030 with virtual address
spaces for each process then this would not be a problem.

There are just too many 68000 based machines out there for it to be
justified at the moment.

727. MEGA STE WON'T BOOT AT 16MHZ WITH CACHE. HELP!!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-03 16:43:40 UTC
From: v892127@gomperts.si.hhs.nl
Message-ID: <CKnqGs.Bu1@si.hhs.nl>
Source record: 34510
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Yesterday evening, while I was working with 1ST Word plus, suddenly
my Mega Ste crashed. After that I pushed the reset button, but the
system refused to boot. After some attempts I now know the system halts
after loading GENERAL.CPX, which tries to switch the system from 8 to 16Mhz.
I also tried "speed_sw.prg" which does the same thing, but unfortunately
without luck. So it seems now the Mega Ste won't boot at/switch to 16Mhz.

Does anyone know what's the problem here? Is it the cache memory or something
else (16Mhz signal?) ?

It was none other than Chris Ridd that wrote on the 26 Jan 94 that ,
>> Upgrade to TOS 2 I/m afraid , AFAIK with early TOS you don't get the
>> extra window's ,just some of the other features ,IE you can at least
>> set the Window Colours. BTW even with Fully Compatible TOS's you
>> cannot get 40 Window's at the desk (8 only) it is only from
>> application's (and only those that are correctly programmed) that
>> will support the 40 windows.
CR> Not true - earlier TOSes *do* allow more windows. The desktops don't,
CR> but that (as they say) is another story... I'm running UK TOS 1.04
CR> and WINX 2.2 with no problems.

Apologies if I misinformed (I use TOS 2) ,the impression given in the manual
was that no extra window's were avavilable (certainly is the case with the
desktop) and I assumed that along with some of the other window
enhancements this was not available to TOS 1.xx. With 2.06 you do get all of
one extra (Total 8) desk window's.

CR> You do have to mess around with the other \auto programs to get WINX
CR> installed properly - the best indicator of a correct install is the
CR> WINX.CPX displaying four scroll bars (for scroll-bar delay and
CR> stuff). If they don't appear, WINX isn't alive.

Indeed ,or by checking the cookie jar .Also I suppose that other features
like window updating and background window enhancement's are active.

CR> I spent hours juggling my auto folder, if that's any guide... Prime
CR> candidates for juggling are UIS III (although *very* new versions
CR> are Ok) and almost anything else that patches the AES.

I have found it to be remarkably tolerant of all the other stuff in my auto
folder ....maybe I have a nose for cleanly programmed code :-) I run it pretty
close to the top of the folder.

AG> But you'll have to run low resolution for that :-)

Not neccessarily , you may be lucky enough to have a Falcon or a Graphic's
card :-) Even so in STmed or indeed High you can set the fill pattern's of
the window's scroll's,box's etc to give 8*3(24) or 8*1(8) shades of the basic
colour's (resp). All fairly superficial to the real benefit's of WinX
but I like a nice pretty display :-)

Just use Mupfel Version 1.2 as you can exec. GEM progs from it (and its smaller)
I tried Mupfel 1.99 but I didn't like it, besides it's all in German, unless anyones got an English hack of it, I'll just stick to 1.2.

Andy.

Actually, 2AM was enough. But your solution is way too compatible; I
decided to flip the bits over to the extended object STATES, leaving the
actual bits (9 and 10) the same.

The ICD software is capable of writting partition information without a
format, at least to embedded SCSI devices (not sure about MFM). The current
version is 6.2.3 for the non-Pro level software.

I encountered the phantom typist a few times while using TOS 2.06 (which
has the same AES as TOS 3.06) - so at least it wasn't completely fixed.

There seems to be no way for an application programmer (or a user) to
avoid "the phantom"; however, the newest version of WINX (2.2) contains
a patch that _probably_ fixes the bug (it's hard to be sure since the
bug is so D***ED elusive...)

All it does is toggle the TT-RAM Mallocable and TT-RAM loadable flags in the
executable's header. MiNT (and any other program) will run without them
being set as they only inform TOS that the program MAY use TT-RAM.

I'm sure that's news to DEC! :-)

GEM was licensed from Digital Research, now part of Novell.

I've read many articles in this newsgroup that say the Falcon has a 16bit data bus. This is not what it says in the manual and is not what was said in the recent thread on memory upgrading (both give a 32bit data bus size.)
Has anyone got any hard info on the subject? (e.g. anyone who has upgraded the memory themselves should know.)

only if you put it after MiNT in <BOOT>:auto\ . The manual correctly
suggest putting it before anything else. MiNT (on 680x0 ataris)
will correctly stop using the mmu if this is so (for better or worse).
i wish atari would wise up and start supporting the mmu in TOS instead
of madness like above.

Don't you need to compile this with your native compiler, to produce
binaries that'll work on the Alpha?

I'm going through this same process on an NCR System 3000 multiprocessor
(with an unknown number of '486/50 CPUs, and apparently a great deal of
RAM.... du /proc tells me ~200MB when the machine is about 90% idle!);
I'd have everything going perfectly if I'd've had a "stab.def" file
available on Friday.

When I built as, I got 'as', not 'gcc-as', so I'm flipping my $PATH
around when I want to build Atari binaries and when I want to built UNIX
binaries... no problem, I've got a nice bash procedure to do it.

I intend to post a full account of my adventures as soon as I've got it
fully tested; I built the object files for a largish program friday
afternoon (since I had everything that I needed except a cross-compiler
ld) and it linked/ran fine as soon as I got home. The NCR box churns
code quite a bit faster than my ST... ;-)

In <scotty.759704670@sarge>, Scott R. Chilcote writes:
> This message strikes me as being vindictive rather than informative. I'm
> not sure what the point is.

The point is that if anyone in this group suggests to a potential new user that things are all rosey and fine in the Atari world, they're wrong. I feel it is part of my _duty_ as a helpful member of the computer community to warn people about how bad things really are in our neck of the woods.

Contrary to popular belief, I don't really get a kick out of flaming Atari.

> The question shouldn't be which features wouldn't be useful; the question is
> whether a potential buyer finds those features attractive. When you shop
> for a computer, shouldn't you find out what it can do?

You certainly should. Be people should be aware of other things related to each computer. For example, someone looking at the MegaSTe, TT or Falcon might see the LAN port and think, "Gee, I could hook up to the local Mac network to print on a nice laser printer." Nowhere in the product literature will they find out that there's no software for doing that. It may be an attractive feature, but unless you want to write own networking drivers, it's a useless feature.

> As for getting "support", that's meaningless too, unless you can specify what
> kind of support. If you mean repairs, well, buying Atari means shipping it
> off to get it fixed, and waiting. It comes with the territory.

And as such, it might be important. What if the person doesn't know anything about fixing hardware, and they're considering buying the computer for their business? Waiting an indefinite length of time for hardware repairs can be devastating to a small business.

> Now, why grouse about having enough RAM for MultiTOS? Sure it's crowded in
> four Meg. At least it's workable! You can't even boot Unix in four meg.
> Linux and MS windows will wear out your hard disk paging in four meg. It's
> a testament to clean programming that MiNT uses as little space as it does!

Linux boots and runs fine in only 2M of RAM; UNIX isn't as huge as you think. MiNT is quite nice, I use it all the time... but MultiTOS in only 4M of RAM leaves very little RAM free for other things, like programs.

> I do agree that Atari could have made it easier to upgrade by allowing an
> intermediate step between 4 Megs and 14. However, you aren't going to save
> an awful lot by going to 8 megs anyway, and serious users may want the extra

> room.

2M of which is useless and wasted. 8M would be sufficient for most
people on the Atari platform... after all, the programs tend to be
pretty small. I'll wager I could do C++ programming with GNU C++ AND
work on a PageStream document in 8M with MultiTOS running... in 4M I
can't even compile C++ programs with MiNT running. 16M would be
expensive, and overkill, though I'm sure I'd find something to pack in
there.

> As for software, what do you mean? Telecomm? Midi? DTP? Word Processing?
> Spreadsheets? Databases? Editors? Unix programs? Compilers? Games?
> There's loads of them.

All unsupported and orphaned. If the person wanted to go to the store
to buy program X, they'd be out of luck. I'd sure hope they'd have
access to a mailorder place, or at least an FTP site... if not, they're
SOL.

> State of the art? Probably not. Specialized productivity stuff? Not there.
> But that's no reason to dig a hole and toss it in!

If the person was looking for a general use computer, the Falcon is
almost useless. It's perfectly suited for special needs though.

> Perhaps a dose of perspective is needed. All cars can't be Ferrarris, but
> they can get you about more than adequately!

ARGH! Another car analogy...

A car with no gas won't get you anywhere and a car with a go-cart
engine...

Presumably for the entire system, not for each application? This does not seem like enough. i open at least one station per windowed dialogue, and often more.

>I tend to only ever open two - one for my application, and one for any
>PROGDEFs I'm using - this saves doing too many VDI enquires and
>restores.

There should be a vdi_reset() type function, so you can clear to a set of defaults.

I'd like to upgrade the memory on my 1meg STFM with a SIMM board and 4 megs.

Has anyone here done this?

Any info on where I could get this done, or the hardware necessary would be
great.

Mike

Hey Dom,
I can't answer your question but have one of my own.

I recently sold (not to you) my copy of US and PGS2.2 along with a lot of hardware, shipped it and now the party won't pay all the $$ we had verbally <phone> agreed on. My Q's this,

What is the street value (average, fair, whatever), for A complete registered Ultrascript package, + US font package, these days ?,

Also same Q for PageStream 2.2 all disks, manuals, 100's of PD fonts?

and

Calamus 1.09 with the Calamus Font Editor, too?

Note, all are registered and transferable.

I would very much appreciate info or opinion on these values US$$ please. from you or anyone else who knows or feels like he/she does.

Don Nelson, don.nelson@launchpad.unc.edu

PS my case to the judge may be helped by this info, if it comes to that.

There was supposed to be a C++ package from a developer in the US called Comeau C++ released last November (commercial software). In the first AEO Programmer's Journal, they had an interview with the author. It was supposed to be fully compatible with Lattice C. Has anyone heard any info since last November?(And yes, I know G++ exists).

Turbo ST has been unsupported for a while now(2 years?). What about Warp 9 or NVDI? Much better products. Why would someone want a slow cludgy program like Caligrapher? Good riddance to it. There are plenty of PD/Shareware AND commercial word processors that ARE supported. If you want a "Doucument Processor" like Caligrapher (read quasi-dtp), why not try That's Write by Compo, Easy Text Pro Vector, Atari Works,or Calamus 1.09. If you need more than that, you should be looking at Calamus SL, Pagestream, or Didot. As for GFA, why not move on to a more professional BASIC-Hisoft Basic-fully supported in North America and Europe and they claim compatibility with the various Microsoft Basics on the Dos platform(Quick Basic). You named 3 products out of hundreds(thousands ?) available for the Atari line. Please dont mistake your own ignorance for the reality of what is really available.

>not impossible... with small code, it shouldn't be such a problem.

As someone else pointed out, there are occasions when you don't know if you should relocate a particular location (relocation when the program is running is harder, because you have to relocate all the pointer values as well). The example used was

```
union u {
long value;
void (*func)(void);
}
```

If an object of type u is being used as a function pointer, it needs relocation. If it's being used as a long value, it doesn't. (Leaving aside the question of *why* you'd want to do this...)

>>MiNT does allow code sharing, for processes which are specially written to
>
> and how is that done?

The code is specifically written to avoid absolute address accesses. All accesses are done relative to a register (then, to relocate your program, all you have to do is change the value of the register).

>I guess it's back to the drawing board... i tried to implement my program

Message-ID: <A29482@HH.maus.de>
Source record: 34443

```
E>May I ask if there is a Freeware Oberon-Compiler available for the
E>Atari-ST, or otherwise source code in Modula-2 for a Oberon-Compiler
E>that produces M68k code?

The following is a *german* announcement for an Oberon-2 compiler.
The authors address from Internet is "stephan_junker@AC2.maus.de".
Not freeware but shareware, and very new.

Greetings, Hayo

------------------ snap ------------------------------------------------
Programm-Name: STJ-Oberon-2

Version: 1.23 (Beta) vom 11.1.94

Programmtyp: Programmiersprache

Status: Shareware, leicht eingeschrï¿½nkt

Beschreibung: Alles was man zur Programmierung auf Atari-Rechnern
braucht:
- Oberon-2-Compiler mit integriertem Assembler
- Linker fï¿½r alle Programmtypen
- Source-Level-Debugger, der nach Abstï¿½rzen und
sonstigen Ausnahmesituationen Quelltexte
und Variablen anzeigen kann.
- Load-Time-Linking als Zusammenfassung von Linken und
starten oder zusammen mit Chatwin eine richtige
LTL-Umgebung.
- Online-Hilfe in Form eines Accessories, daï¿½
Bezeichner in Definitionsmodulen anzeigt.
- sowie etliche Utilities wie Make etc.

Neuheiten: - Debugger, Online-Hilfe und LTL-Umgebung
- Module fï¿½r Popup-Menï¿½s und Textanzeige im Fenster
- Accessories kï¿½nnen jetzt auch programmiert werden.

Behobene Bugs: zuviel um Aufzuzï¿½hlen :-)
Praktisch alle die seit V1.22 bekannt wurden.
Insbesondere funktionieren typgebundene Prozeduren
jetzt viel besser.

Bekannte Bugs: - Geringfï¿½gige Inkompatibilitï¿½ten zum Oberon-2
Standard.
- Garbage Collect im Hintergrund geht noch nicht.
- Optimierung macht Probleme
```

Einschrï¿½nkung: - Keine Optimierung
- Doku als TeX -> TXT Konvertierung
- keine Sourcen

Hardwarevorr.: Atari ST/STe/TT/Falcon

Betriebssystem: Alle SingleTOS, MTOS (LTL ohne Speicherschutz), Mag!X
(nicht getestet, mï¿½ï¿½te aber gehen)

Autor/Kontakt: Stephan Junker @ AC2

Is the TT ram the standard Atari supplied daughter board or a third party
one (GE soft?)?
The atari will take 4M SIMMS but you will have to change the dip switches.

I have the TT service manual at home and will post the switch settings
tomorrow.

regards dennis

Correct me if I'am wrong; Turbo ST is an rewritten TOS FileSystem since Warp 9
and NVDI are rewritten VDI. Its a very different consept.

And btw. you don't need an Turbo ST any more 'cause TOS 2.06 FS is evan
better than Turbo ST:s . In Fact Turbo ST is rather incompatible.

|> thanks in advance ....

I did some testing over the host port yesterday, and I got throughput at 1-1.5 Mbyte / sec. That is I sent data to the DSP, stored it in a (circular) buffer in the DSP, and sent it back to main memory. It didn't take more than ca. 1 sec to send and receive 1 Mbyte of data.

I don't know - maybe if you optimize things a little you could get better results.

You are wrong <grin>. TurboST was a screen accelerator, very similar to
Warp9 (in fact, QuickST and TurboST were constantly being compared to
each other when in their heyday, QuickST being the precursor to Warp9).
Now, someone can correct me if I'm wrong (fair is fair), but I believe
there is a similar precursor relationship between TurboST and NVDI. NVDI
does more, as it also provides a better high speed GDOS replacement.

TurboST was abandoned (or upgraded to NVDI) a couple of years ago.

From: petep@info.isbiel.ch
Message-ID: <2j8b93$f5@vega.info.isbiel.ch>
Source record: 34451

for my studies in digital signal processing i would like to write a
mutlichannel-harddiscrecording-tool.

that means:
in a 1st step i'm recording a guitarplayer in realtime on the harddisk.
then on a next step i'm recording the voice of the song. but while the singer
is singing he can hear the guitar recorded before in the headphones. we have
therefore to read from one file on the harddisc and to write to another file
on the disk simultaneous. can the falcon030 handle this (in cd-quality or lower)?

please e-mail me (petep@info.isbiel.ch)

I too had this problem, but the solution to mine wasn't a bad
solder joint. The system would work fine with the top off, but
when I put the top back on, it wouldn't. It turned out, there
was a ceramic donout pressing up against a resistor which stood
up considerably on the powersupply. This pushed the resistor leg
up against something else causing a short.

TurboST was a screen accelerator that was one of the competitors
of QuickST/Warp9 (I don't think NVDI was around when those first came
out). TurboST was not a filesystem rewite... (see below)

There was some other program that had "turbo" in it that sounds
more like what you are talking about (it's probably buried deep in
my archives somewhere :-) but if I recall it gave me occasional
problems, and was sentenced to the disk dungeon. If I can track
down a copy, I'll post something describing that program...

>"can't start GEM programms".
>
>Is there really no way to do this?

Okami programmers (another shell) encountered the same problem and managed to overcome it. A Small programm called MicroShell, that is a GEM program, calls the Okami Shell (TOS program), that can now run GEM programs, too...

Get an eye on it...
Maybe is is possible to use the microshell with Mupfel instead of Okami (I didn't try it) but anyway, okami is good, too... Just a bit buggy under MultiTOS, that's why I ran back to Mupfel (I leaved Tcsh/Ksh etc... Huge !)

I think you may be confusing Turbo ST (which *is* a screen draw accelerator in the mode of Warp 9 / NVDI) with TurboDOS (or even FATSPEED). Believe me, Turbo ST is a screen accelerator -- I have a copy.

Mickey> replacement.

Indeed, the gentleman was confusing TurboST (the VDI accelerator
shareware program) with TurboDos (the tos < 1.4 FAT speeder). TurboST
was tested to be a bit quicker than quickst, Darek Mihocka's screen
accelerator, in some functions and a bit slower in others. TurboST
became NVDI and QuickST became Warp9.

Turbodos was abandoned to fatspeed, largely due to incompatibilities,
and eventually obsoleted by the new TOSes...

Legend has it that NVDI is more compatible than Warp9, while W9 offers
more "Neat Stuff" than NVDI.

Just to get that all settled!

Suppose I wanted to cross-develop MiNT/Atari applications on my Amiga 1200
with 6 meg RAM, 260 meg harddisk and gcc (v. < 2.5.6). Would it be possible?
From what I gather, I think Gas object files are the same on both machines.
Would I have to recompile the linker (ld?) to produce MiNT/Atari executables?

No flames about me being involved with both machines as they'll go directly to
/dev/null ;-)

There is a function in mintlibs called tfork. It takes a
pointer to a function and a long as arguments. It will start another
process using the same code and data. The child will start at the
function you provide and be given the long argument you provide.
There are just two problems. Files opened by the parent won't be
opened for the child. And, the mintlib readme file says that some
library calls such as malloc need to be wrapped in semaphores.
I wonder if simply wrapping malloc in a semaphore is enough.
You have several threads calling malloc in a nice orderly way. malloc
calls the library func sbrk, and eventually sbrk gets another chunk of
memory from the system using Malloc. Now there is a chunk of memory
in general use which is only owned by one of your threads. What
happens when this thread terminates?

There are several gateways between the InterNet and the MausNet, simply mail
to Siegfried_Hartmann@b.maus.de and tell him your problems.

I'm only wondering why you are still using the old HSModem 1.05. Harun has
written a new serial driver (the archive is called HSMODA02.*) and developped
a card adding two 115KBaud FIFOed(!) serials to a standard ST.

"Small ADA (sic) compiler" is an oxymoron. To my knowledge, there is no
Ada implementation for the ST/TT. I do remember hearing something about
a GNU GNAT port, but I don't know how well that is progressing. Sorry!

Now this is definatley not so. If a person has an Atari store around,
then there are a lot of products that are not discontinued or
orphaned. If they have ftp access, then they have a very useful
platform with a lot of quality stuff.

>> State of the art? Probably not. Specialized productivity stuff? Not there.

The Falcon is a great general purpose computer - that's what I use it
for. Sure you should know what you are getting into, but if you have
access to support then the Falcon is a very nice machine, and I'd say
easier to use a more friedly that DOS or Windows... but that's anther
issue.

>GFA Basic - GFA are moving over to their PC version.
>
>GST Software House - Plays at Atari support.

And for every dead software you list I can list two that are alive,
under development, and very useful:

Atari Works - Can buy in store, good starting WP
Tax Pro? - Can buy in store, current 1993 tax prep software
Superbase - good database program
Calamus - Excellent DTP program, still developed and supportred
Diamond Edge - Compariable to Norton utils for TOS HD's
Straight Fax - Can buy in stores, as good or better than crummy Win. Fax prg.

Bringing up a list of three discontinued software prooves nothing, and
also DOES give the impression of an anti Atari platform bias.

>the question of *why* you'd want to do this...)

Although in the MiNT way of doing things, code is never relocated after the
initial load, so this is a bad example. Better would be one using a regular
data pointer in the union. Even so, this problem can be attacked by comparing
the value of the field to all the existing data regions. If its value resides
in a data region, it should be relocated. Yes, in the truest sense, the problem
is too ambiguous to be perfectly solved, but pragmatically speaking, when will
these situations occur?

>>>MiNT does allow code sharing, for processes which are specially written to

>> and how is that done?

>The code is specifically written to avoid absolute address accesses. All
>accesses are done relative to a register (then, to relocate your program,
>all you have to do is change the value of the register).

All data accesses are relative to register a4. Text (code) references are still
allowed to be absolute. The program must not use self-modifying code, either
(but that's a good rule of thumb for just about anything anyway).

To avoid running out of the 64K of addressable space, store all arrays,
structures, and other aggregate data types in a "blockdata" or "blockbss"
segment, and store their addresses in the regular data segment. The process
memory map then looks like:

...
blockbss
bss
a4--> data
blockdata

```
...
text

Then e.g. the assembly language declaration of "char buf[1024];" becomes:
.bbss
buf: ds.b 1024
.data
buf.ptr: dc.l buf

and references to the array buf which used to use (e.g.):
lea buf,a0
become
movea.l buf.ptr(a4),a0

etc...

(The above is a slight simplification; it's best to set a4 to 32K above the
start of the data segment, and subtract 32k from each symbol reference, to
allow getting the full 64K of address space in a linear fashion.)

782. Flopfmt(), what settings for 1.44 floppies?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-09 02:40:15 UTC
From: wilsont@rahul.net
Message-ID: <CKxrF4.40@rahul.net>
Source record: 34465

I can't seem to find any info in the dev docs, sooooo.

How many tracks and sectors are there on a HD floppy? 160 tracks and
9 sectors/trk or 80 tracks and 18 sectors/trk?

Currenlty, I use 80/9, and do both sides, but that gives 720k.

What Protobt() type do I use for 1.44 megs?

Thanks a lot!

Thanks... I'll try to get it tomorrow.

I hope this one works better than the 3.x one on atari.archive; it
produces 11 bombs under MiNT with no GEM running (INIT=tcsh or INIT=sh),
and a BUS ERROR under MiNT + GEM + TOSWIN. :-(And my program
bus-errors all by itself and I'd like to know where!

I agree, but what about the fururе? Atari itself is no longer
developing the Falcon and it may take quite some time before they do
so - if ever. What if Calamus makes it to NT? Will they still support
silly old atari?
As for me - the thought of buying a 486 PC doesn't make me jump for
joy, but I'm also reluctant to fork out my savings to a dead-end
product. I also think the Falcon is a very nice computer (portable
too!), but I'm afraid Atari has introduced it way too late to make it
last..

DOWNLOADING FILES, Instructions:
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR] OR use the number address,
NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once. i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having to reply "y" for each
file
when asked "get {filename}?".
12) close [CR] to end (go back to ftp and
13) quit [CR] to go back to UNIX or.....
14 bye [CR] to end and go back to UNIX

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the
programs
were intended, or in UNIX .....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or
.uu.
Use the appropriate uncompress program for this.
- ls [CR] lists files (shows all files in current directory).

- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...)
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an
other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer.
i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".
- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

No, the jar is not the best test -- I got a WINX cookie Ok, but no
WINX, which puzzled me for ages :-)

The best test is in the programming documentation, it is a parameter
to wind_get().

I have an Hayes-Modem (LC 144 VF from Creatix) connected to the RS232-Port of an ST.

I send ATZ1\n to the modem and echo is intially turned on.
I receive the same line as echo (as exspected) but nothing else!!!
Can anybody tell me, how to get the missing line(s) including the desired "OK"?

Do I have to send a <LF> or something after reading the first line?

Regards

Helmut

I can only give you the advice either to choose the GDOS to print your pages
or use the diablo driver for that. A direct programming of the DMA-hardware
will cause incompatibilities to future expansions such as the Heatseeker,
which allows you to print SLM-pages on a Falcon, allthough it hasn't got
an ACSI-DMA-logic.

> Who can tell me how to connect a second Hard DRIVE in my SH205 (MFM 20Mb) on
> the second port SCSI (DS1) ???
> What sort of HD can I connect on it ?

Only MFM drives with a ST506/412 bus - no SCSI drives! Adding the second
drive is easy. ST506 drives have two cables, a 34-pin and a 20-pin cable.
The 34-pin-part of the bus is shared among drives, the 20-pin cable
is not. So you just plug the 20-pin cable of your second MFM drive into
the the main board and connect the 34-pin cable to the 34-pin bus using
a Y cable or something like that.

Hardware is not the only thing to consider, though. Only a few
hard disk drivers will recognize the second drive in the SH205.
At the moment, I can only think of two which support such a
configuration: My own (CBHD) and Uwe Seimet's HDDRIVER. AHDI
will *not* recognize the second drive.

> What is the signification of RLL or MFM, are they compatible ???

You can use an RLL drive with an MFM controller such as in the SH205,
but usually not the other way round. RLL is a bit recording method
that puts higher strains on the platter material and the electrical
data channel. Most MFM drives will not hold data in RLL format
reliably.

Has anyone had any problems with the mega 2 st power supply. Specifically, the fan. I had to flick it to turn and then it would continue to boot. Eventually, this didn't work any more and it would take about 30 -40 minutes for it to slowly boot up. It seems that the power was gathering, and when it reached a certain level, it was ok to boot up.
If anyone has any suggestions or knows of any place in Southern Ontario that deals with ataris' please let me know.

Thanks

Approximately always :-)

But there is another problem: tagged pointers. That's why dumping
emacs is such a pain on the atari (on the TT with memory protection it
is a bit better, since all memory blocks are aligned to 8k
boundaries).

If the object files are of the same format, then just compiling the
Atari linker on the Amiga should work.

>The title says it all - does anyone know of a small ADA compiler
>for the ST?

Short answer: No.

But there is light at the end of the tunnel. The GNU Ada project (GNAT) is heading towards completion, and doing an ST port of this would be as easy as doing a port of gcc. (In fact, doing a port of gcc will be the same as doing a port of GNAT, because GNAT will eventually become part of gcc!)

Be warned that GNAT isn't going to be small -- the OS/2 version requires 6-8 megs. gcc for the ST runs OK in 4MB, but would be better off with more.

It's 80 tracks and 18 sectors (actually, there is enough place for 20
sectors, giving you 160k more).

Mupfel can run GEM programs when you rename it to mupfel.app and set or reset the shell flag G (don't remember which way round).

This alert box comes up if you call the AES with an unknown function
code (i.e., control[0]), but not if you pass illegal parameters with a
legal function code.

Yeah thats exactly what I mean, I still think that its name was Turbo ST.
The main reason why it was produced was the TOS 1.00's crappy FS. Those who
use still use TOS 1.00 and Harddisk might know of this program.

801. TT fastram jumper connections

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-09 12:42:09 UTC
From: dba@jet.uk
Message-ID: <1994Feb9.124209.410@jet.uk>
Source record: 34484

Allison:

The atari TTFAST ram board (CA401058-xxx) uses 30 pin SIMMs.
The SIMMs may be 1M x 8 or 4M x 8 (9 bit SIMMs may also be used).
All 4 SIMM slots should have the same type (ie. 1M or 4M).
1M SIMMs give a total of 4Mb of fast ram, 4M SIMMs give a total of 16Mb.

The jumpers required are as follows:
SIMM type jumper W101 jumper W102 jumper W106
1M x 8 2 - 3 2 - 3 2 - 3
4M x 8 1 - 2 1 - 2 1 - 2

Starting RAM Address jumper W103 jumper W104
$0100 0000 2 - 3 2 - 3

Address Mode jumper W105
NON-BURST 1 - 2
BURST 2 - 3 (default)

location:
| mmu chip |
| |
____
W105
W106 W104
W103
W102
W101
| | | |
| | | |
SIMM slots -> | | | |
| | | |
| | | |

It is possible that during manufacture there was a shortage of SIMM holders
and SIPPS were used. The pinout is identical to SIMMs but pins were soldered
to the connectors. If this is the case then you will have to purchase some
SIMM holders.

Hope this helps
dennis

With "Pump up the Volume" on the ST you can comfortably format up to
a 1.66meg disk (you can format higher, but 1.66 seems the most reliable
and "disk-drive-friendly")...

On the PC, there's a program called FdFormat that will comfortably
format up to 1.72meg (the extra 300k is really nice :-) It does
this with "82 tracks/21 sectors" ("Pump..." doesn't give a *21* sector
option)...

And to think, I was happy when I was able to format to 180k on
my 8-bit, way back when :-)

That's absolute and utter rubbish. Let's go one by one:

This list is of SUPPORTED software

Telecomm: Connect and Stalker are the two I use and STraight FAX
MIDI: too many to list, I use Cubase
DTP: too many again, Calamus and others
Word Processing: too many AGAIN. That's Write, Papyrus, Atari Works...
Spreadsheet: Don't know
Databases: Atari Works includes one, Superbase Pro V4
Editors: too many again. I use Everest
Unix Programs: don't know
Compilers: HiSoft actively support BASIC, Pascal and C.
Games: don't know

I believe it was turbo st. Before I upgraded to TOS 1.4, this program
was a permanent feature of my Auto folder. It worked perfectly for
just about everything. The only incompatible program I found was
Megamax Laser C compiled programs. Something to do with the way the
compiler's runtime library set itself up....

Cheers, Steve

Unless there are two products called Turbo ST, something is weird here! :-)
The TurboST I was talking about was available in North America about 2 years ago and was a compeditor to Quick ST(which evolved into Warp 9 when Codehead Software bought the code). So Turbo was a graphics speed up program. I don't know the details on how it works, I was merely offering a more up to date set of choices for a similar type of program. So, Ville, I won't correct you, cause I don't know who's wrong. I do know that I am confused on Turbo though!?! :-) Take care.

The turbo ST available here in North America was indeed a screen accelerator-that is what I was refering to in my original post when I offered Warp9 and/or NVDI as alternatives. Further posts from others seem to indicate that there were 2 products called Turbo.

I am having a big problem with my STe. It keeps rebooting when ever I finish running anything. I just got it running a few months ago (it wasn't accessing anything and wouldn't boot at all). I just installed SuperBoot. My AUTO programs are:
Superboot
STEFIX
Consfix
AMCGdos
I am using a 1040 STe with 2Meg ram, Atari color monitor, panasonic KX-P1123 printer, Supra 2400bps modem, a Maxtor 245Meg SCSI drive, and ICD AdSCSI +.

I first noticed this problem when I tryed to install the Okami 1.5 shell. After the problem surfaced any apps cause 2 bombs then 2 more bombs and the STe reboots. Under Okami most .TTP programs won't run and Okami leaves the message "Killed", the returns to the prompt. I would like to get a good TSCH clone that will run on my STe. Any and all help will be appreciated.

Thanks in advance,

-Thomas

814. Problem with ICD Link

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-09 18:58:34 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CKz0pn.6B5@watserv2.uwaterloo.ca>
Source record: 34347
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am having a problem with a new ICD link, I'll try to detail it:
(First not that I am upgrading from an Advantage+ and using UCD util 6.2.0)
The Link was working for two weeks fine and dandy. I still do not have a
manual for the Link since the store hasn't gotten a new one yet)

1. I bought the Link to replace my Advantage+ so I could sell the + to my
friend along with my Seagate 296N hard drive. I also have a Quantum LPS105.
I just bought a Maxtor 213SY to replace the 85. I first hooked up the Link
with the 85 and 105 before I bought the 213. It worked fine (85 was ID 1,
105 was ID 0, 105 at end of cable with terminating resistors in.

When I hooked up the 213 as well, ID 2, resistors removed, it all worked fine.
I then copied my important stuff of the 105 and 85, repartitioned, etc and
set up the 85 for my friend. I then took out the 85 and left the 105 (ID 0)
and 213 (ID 2) with 105 on end of cable and terminated. The computer no
longer recognizes the fact that there is a host adapter. I put the
advatage+ back in and it works fine!. I changed the ID of the 213 to 1
and it works fine with the Advantage+ but the link does not seem to be
there.

I took it to the dealer, they tested it and it works fine. I took it to
my firends house with the 85 (terminated and alone on the cable) and
it worked fine there too. Is it possible my Mega STe is not supplying
the proper power. To hook up the link to my existing cable, I crimped
a 50 pin female centronics directly to the cable, does the link require
terminators at that end too? The advatage doesn't need termiators there.
I think this might me my problem but I'm not sure. Anyone else with a
similar experience have anything to tell me? Or anyone with a link
manual?

Thanks for any help,
Sam

>Thanks a lot!

Use 18 sectors/trk and 80 tracks. To create a boot-sector for HD-disks,
you have to call Protobt() with the following parameters:

```
char buf[512];

Protobt((void *)buf,0x02000000L,4,0);
```

This will only work, if you are using TOS 1.6 or higher and if the
"_FDC"-cookie is installed. Otherwise you have to "manually" create
a boot-sector and write it directly to disk using Rwabs().

|>

By the way my posting was much more imprecise:
-AEO_0220.txt is about 220 Ko of text-file.
-The 15s has been achieved on a Falcon030 but that's not the point.

In fact it can compress within 1s even on a ST but the resulting size wont't
be the same. I must add that both compression rate & time required are exponential.
Id est you can either pack very quickly (rate 95% or 90%) or achieve better
rate (max 20% of original size) with much time. I think that the product I'm testing
isn't bad at all, it is always at least faster than Ice Packer 2.4 and the resulting
size is comparable to Atomik packed file... And it is real-time packing !!!!

To use such tool, for normal day use you choose a low offset while
you can optimize your hard-disk with a very high-one (decompression time is always <1s).
Its release date is nearing so you'll be judge ..

I call again, is there anyone on the net who owns DATALITE (by Hisoft)
and could evaluate time and size results for sample files ?

>manual?

Looks IMHO like the LINK is not being recognised unless the '85' (ST296N?) is connected, perhaps this drive was supplying the +5V required by the LINK, which gets its power from pin 26 ('TERM POWER') on the SCSI bus, generated on one of the disk drives and often supplied via. a fuse, whereas as far as I believe the 'Advantage +' does not require to be powered in this way.
It may be that the LPS105, although terminated, does not supply the 'TERM POWER' required by the LINK, and that this was being supplied by the '85' before it was removed. Perhaps if you were to try reversing the order of the drives, making the last drive the 213SY and terminating that one instead of the LPS105, 'TERM POWER' may be available from there.
I had a similar experience with an HP 7959S drive, which I recall did not supply 'TERM POWER' when terminated.
Another main point to note IMHO is that the LINK does not support parity and requires that parity is disabled on any drives connected to it, whereas I understand that the Advantage+ supports parity.

Hope this is of some interest,

Best Regards,
Brian

The Link gets its power not from the ST but from the ``termination power''
supplied by one (or more) of the hard disks. Most hard disks have a jumper
by which you can enable/disable the termination power line from the drive.
I would guess that among your hard disks, only the ``85'' is supplying
termination power. Solution: Enable this jumper for _all_ of your drives.
(Multiple power suppliers is O.K.)

Sounds like you need to make the 213 bootable. Use 'ICDUTIL.PRG' (?)
to write the bootstrap loader into partition C: of the 213. It worked
Ok before because the 85 already has a boot loader. (You only need
one drive with a loader, more than one is quite safe, though).

>I took it to the dealer, they tested it and it works fine.

Your dealer should have spotted this problem. Did they boot it with
only your drive/link on their hardware? I'll bet they didn't!

>I took it to
>my firends house with the 85 (terminated and alone on the cable) and

ICD's DMA->SCSI hardware is remarkably tolerant to incorrectly
terminated connections, so I wouldn't worry on that count.

So, basically, just run that hdutil.prg to make your 213 bootable...

Cheers, Steve.

Yes, but apparently you need GCC >= 2.5.8 to produce working 68000 code. If
you're only targeting 68030s, no problem ...

Where did you get this idea? If the gcc's on my CD-ROM's (2.4.5 on
Oct93 and 2.3.3 & 2.5.7 on Dec93) didn't produce working 68000 code I
would have thought at least one customer in the last 5 months would
have complained about the dozens of GNU C compiled executables that
did run, including the compilers themselves.

: SIMM's for parity. (It's really 18MB worth of memory in there!)

Huh? The parity bit is used for something all the time. It checks for
stray bits getting stuck, or mysteriously changing. Stops your data
from being corrupted. These check aren't 100% accurate, but better than
nothing.

Have you checked the prices of 9bit vs 8bit SIMMs? The difference is,
if you can find 8bit SIMMs, less than 1/8th. You can use 8bit SIMMs
in PCs, but don't have parity checking.

>ca. 1 sec to send and receive 1 Mbyte of data.

Using devconnect, you could transfer 1 MB in _and_ out simultaneously to the
DSP, and the 68030 is even not involved. With direct IO using the 68030 memory
port of the DSP transfer rates should be higher, I dunno know exact results, but
could you post _how_ you got your results?
Using both, the DMA and the 68030, the perfomance should be highest.

831. 1040 ST Video problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-10 15:44:11 UTC
From: dba@sxb.bsf.alcatel.fr
Message-ID: <306@lacerta.sxb.bsf.alcatel.fr>
Source record: 34364

G'day folks,

a friend of mine has an 1040 ST with an intermittant video problem.

The machine runs perfectly but after some time, it may take
hours or even days, the display starts to blurr as the individual
pixels appear to jitter and scintillate.

Another display was tried but the problem remained hence it's definitely
coming from the cpu board.

I've opened up the cpu several times now and after each time, the machined
behaved itself for a longer than usual period before the problem reappeared.

All removeable integrated circuits have been extracted and reinserted,
including the RAM SIMS and the big PLCC chip in the socket near the video output.
I even sprayed around a bit of GOOP to try and improve any bad contacts......
but all to no avail. The problem always showed up again after a long delay.

I tried bending the cpu board to check that it wasn't a dry solder joint but
that had no effect.

Sometimes the machine will even run for weeks before it starts to play up!

If you can throw any light on this issue then I'd be really glad to here
from you. Perhaps it's a known problem with the big chip near the video
output that I mentioned. Is this the so called GLUE chip?

This is my first contact with the ATARI so I was working somewhat in the dark.
Thanks for any help you can offer....by email preferrably.

Cheers.......Dale

It is. If you give the part number (DSxxxx), I may be able to tell you more
(please mail me - my newsfeed is a bit flaky).
Those Dallas parts combine an IC (usually real-time clock plus SRAM) and a
Lithium battery which should last for 10 years.

Well - I haven't read those previous posts, but in this case, he is absolutely
true. Wasting 2 Megs of memory is braindead.

RT>It's not a Falcon problem, it's a compatibility problem. (IT uses the same
RT>address for the ROMs as the old STE to be compatible)

That's OK - but who says that you can't relocate those 2MB to addresses above
16MB? The 68030 has a 32-bit address bus, with 4 GB address space. I think
about 1 GAL more in the falcon design should have been enough to relocate
those 2 MB.

This is no flame against the Falcon - it's just that I'm fed up with Atari's
half-hearted hardware designs. Most Atari computers I know have minor flaws
like the above which could have been easily avoided during development at no
or little extra cost.

Um, that just means it's an ANSI C compiler; that first declaration is
an ANSI C construct, the 2nd is old-style, or K&R C.

> I just _wish_ someone would do a nice C++ for my Falcon, I could get GCC I guess,

Well, if you have lots of RAM and MiNT, you could probably use EMACS;
there is no integrated environment for GNU C.

I prefer a good shell and Makefiles myself...

G++ 2.5.8 works fine on my 4M ST, with -O. You'll run out of RAM on
large classes though... there's no way to fix that.

Perhaps Comeu C++ (a cfront port that uses Lattice C as its back-end, I
think) will be less memory-hungry.

Yes, big earsa. But, let's get to the point: when I see 'Falcon -buy ot not?'
in my subject list and nine out of ten times the messages appear to be
one-liners about outdated screen software, one gets to get a little annoyed,
wouldn't you agree? For me the question at hand is rather actual, since I'm
somewhat outgrowing my current computer. So, to me it
would seem more appropriate to change the title of the ongoing thread in
something like 'uninteresting screen software talk' - instead of issueing
silly advice to me..

The whole POINT of VDI's is to allow you to open more than one. Otherwise
you spend all your time reseting VDI attributes because you don't know what
some other part of you application has done to them.

I open one per window and the ABSOLUTE minimum. All complex PROGDEF objects
also have there own VDI. A maximal program would have say 4 + 4 * #windows
VDI's open at once (ie. around 20 for a typical use). The NVDI limit of
64 seems like enough. Maybe even if it was system-wide (although it is
awefully CLOSE to the minimum!).

Anyway, I'm not going to use less VDI's for ANYONEs benefit.

I have the Falcon hardware schematic and it IS DEFINATELY a
16bit data bus BETWEEN THE CPU AND EVERY THING ELSE. the video data bus
width is either 32 or 64(can't remember) ie the top 16 data lines
D16-D31 are floating free ....not used ... unconnected... etc

Hello.

I've got a 1040 STF with a TOS-Card 2.06 and a IMEX II Memoryexpansioncard.
Since now everything worked fine, but now while booting, when I see the
ATARI-Logo there are some sprcles on the right side of the screen. When more
text comes there are more sparcles on the right side. But the Bootmenu will
never come.
While using the old TOS, the desktop comes, but also do not look very fine.

How can help me ?

Thanx, Tichel.

845. Help with Falcon sound bits

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-11 12:30:26 UTC
From: I.M.Rae-SE1@cs.bham.ac.uk
Message-ID: <2jftp2$bq0@percy.cs.bham.ac.uk>
Source record: 34378

As part of my Final year project I have been trying to write an oscilloscpe/spectrum analyser on my Falcon. The basic plan is to use devconnect to send the audio signal from ADC to both DSP and DAC. Use the DSP to do teh calcualtions and then send that to the 68030 program. I want to use interrupts within my C code to work out when the DSP has sent some new stuff and then display it. I used Dsp_SetVectors(receiver,0L) to do this. However it don't work and to be honest I don't really think I have enough info about it... (I kept getting stack exhausted message from Lattice)

So can anyone out there tell me how Dsp_SetVectors works, or a better way of going about it ?

Cheers

Ian Rae | Falcon030 4/120

|> port of the DSP transfer rates should be higher, I dunno know exact results, but
|> could you post _how_ you got your results?
|> Using both, the DMA and the 68030, the perfomance should be highest.

I used DSP_IOStream(), which connects over the host port. I installed
interrupt routines in the dsp for handling the IOstream. The results
varied with how big blocks I sent (naturally). Bigger blocks -> less overhead
= better throughput. I measured the result by checking the 200 Hz counter
systemvariable. I don`t remember exactly what the best results was, but I think
it was around 1.5 Mb/s (in AND out). If you - as you suggest - in addition
simultaniously use devconnect to transfer data via DMA, you could get as high
as 2.5 Mb/s. As long as the bus don't get saturated...
However, to safely transfer data by DMA, one must enable hand-shaking, which
will probably get less than 1 Mb/sec throughput. I haven't tested this myself,
so I don't know exactly what the result will be.

Hope this clears things up a little.

850. Moving Power Switch and Reset Button

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-11 14:25:46 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1994Feb11.142546.8954@unix.brighton.ac.uk>
Source record: 34383

I have no warranty on my Falcon030 and so I was thinking of moving the power switch and reset button because I need to inflict numerous scratches on my hand or contort to turn the beast on and off (I have it embedded in a computer desk with too much on it!).

I have to slide the thing forward to access the reset switch which is not something I enjoy when the hard drive is bust whirring away.

Has anyone else done this and if so is it easy, where did you move them to.

Cheers

Here's wishing for a tower case with separate keyboard!

I had problems with the machine resetting itself after a while (usually in the midst of typing lots of stuff into my database for hours....). I found out that it was a bad connection from the transformer etc. in the power supply. What I did was to re-heat and put some more solder on/remove old solder on the various points of the power supply. It's been OK ever since.

can this also be installed in my 520 STE? I heard from someone that it could only be used in the ST and STF.
If I don't have space for the 2.5" hard disk, could I just take the cable out of the STE and have an external "normal sized" IDE hard disk instead- do I then need an external

power supply also, or does it have enough power?
Thanks.

853. GCC blues...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-11 16:20:29 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1626@usdtsg.DaytonOH.NCR.COM>
Source record: 34386

Hi. I'm having a little problem using GCC 2.5.8. I realize this
may be extremely neophytical (is that a word?) but if anyone could
clue me as to what I'm doing wrong, I'd appreciate it.

I'm starting to teach myself some programming for the Atari (using
MWC "C" book, as well as the AES/VDi Compute! books) on GCC.
So I thought I'd start something pathetically simply - just a
appl_init() and appl_exit() - pretty straightforward, I'd say.
It compiled fine, but when it goes to link, I get a message along the
lines of "undeclared function _appl_init and _appl_exit."

I have a "#include <aesbind.h>" in the code, and I thought I had
the necessary environmental variables set up (this may be part of it -
is it GCCINC and GCCLIB or GNUINC and GNULIB to be set? The binaries
are set up fine with GCCEXEC). I have the mntolb39 and mntinc39 files
in place. Which library actually has the definition for appl_init(),
etc? (I was "nm"-ing some of the library files, but apparently
missed it).

For those that may be asking "well, if he can successfully compile
MiNT sources, what's his problem?" I managed to munge up my
unix/Mint partition earlier, and had to reinstall some stuff, so I'm
not sure if everything's back in place correctly...

Anyways, any help would be appreciated...

Why is it then that Mac's and ST's don't use parity check? Might it be for the same reason they stick to real CPU's like the ones from Motorola? <g>

> Have you checked the prices of 9bit vs 8bit SIMMs? The difference is,
> if you can find 8bit SIMMs, less than 1/8th. You can use 8bit SIMMs
> in PCs, but don't have parity checking.

And you can use 9bit SIMM's in the STE/Falcon but the fact remains that you can't use 1/9th of existing memory, parity or not. The only reason 9bit SIMM's are cheaper is because they are being manufactured in higher volumes. Makes it an even bigger waste, doesn't it?

856. SM124 screen shrinking!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-11 19:05:48 UTC
From: lancer@planet10.WPI.EDU
Message-ID: <LANCER.94Feb11140548@planet10.WPI.EDU>
Source record: 34389

When I turn on my MSTE and SM124, the picture on the screen seems shifted (scrunched) to the left. The leftmost column of characters is squished to about half it's normal width and looks brighter. After a while everything goes back to normal...

The same happens with my 1040STf, so it's not a computer problem...

And if I start the STf and the monitor at EXACTLY the same time (using a power bar) the problem NEVER happens! The MSTE has a boot delay, though, so I cant do this with my new computer...

Could this be a sync problem? I have a homemade monitor switch box on the thing... Maybe it's a shielding problem?

I'd bet it's just not getting the right sync at first and takes some time to adjust...

Can anyone offer any suggestions?

thanks,
.s.

>
>Why not use named pipes?

i'd really like the programs to share memory. pexec mode 104 should do this
properly, but i get crashes (when i try it)... i guess i should: open a pipe,
pexec the other process, have it allocate its memory and pass the address
through the pipe....

has anyone done anything similar to this and is willing to share the code?

858. Re: Falcon data bus

Kym, kym, kym 8) You're not helping here.

Okay guys, a rundown :

The Falcon, like most modern computers, doesn't have a 'data bus' per se.

There are a number of data busses connecting various devices, some are
8 bits wide, some are 16, and some are 32. (no kym, only the TT has the
64-bit STram databus).

For example, the SCSI controller has an 8-bit databus to the SCSI DMA
controller, which in on a 32-bit databus connected to the memory.

Physically, memory in the F030 is organised 32 bits wide.

The CPU is connected via a 16-bit databus to COMBEL (? fairly sure here),
which has a 32-bit connection to memory. Most of the time, the prefetch
in the CPU is ahead of the instruction unit, so whilst opcode/operand
fetches only come in 16 bits at a time, they're well ahead of time, and
the CPU isn't slowed by this at all.

On those occasions when the CPU needs a 32-bit value, and the cache misses,
there is a small performance hit on the second memory read cycle (about 5
clocks from memory) to get the other 16 bits. This hits things like fast
screen blits, but not much else.

I hope that clears things a bit - making any broad statement like
'Computer X is a nn-bit machine' is pretty silly these days...

859. Internal IDE in Falcon/problems?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-12 04:10:23 UTC
From: lexicor@cs.bu.edu
Message-ID: <2jhkrf$j6r@news.bu.edu>
Source record: 34292

Hi!

I have come up with a problem, my Falcon Harddrive IDE refuses to be recognized for whatever reason, it is unknown to me. When I use ICS boot it identifies that a 65 Meg HD in my Falcon, however I still cannot access any drive or partition. I can't even format it as it won't give my Harddrive a drive recog.

ANy ideas?

Yat

860. Advanced-Music-Formats10.doc [FAQ]

```
Advanced Music Formats - Document version 1.0, By Jamal Hannah 2/11/94
----------------------------------------------------------------------

Lately, a number of different programmers have entertained the idea
of newer, advanced "Module" formats, for music storage and playback.. these
formats take into account most of the following things:
(or at least they should)

* 16, 32, or an infinate number of sound channels.

* 16bit, 44kHz sound samples (CD quality sound for the respective
instruments)

* The file format can be easily enhanced, updated, and expanded, while
still remaining backward-compatible with older software intended to play
modules of the same type. (albiet an erlier version). The "IFF FORM" or
"chunky" style of file structure from Commodore/Electronic Arts seems to
be well suited for this purpose.

* The file format should be able to handle a large number of musical
effects. (Including, but not limited to: all ProTracker and OctaMED Pro
effects, and others, like "wa-wa", "flange", "fade", "attack", "decay"
various type of distortion, etc.)

* Format should handle a large octave range (at least C0 to C6, with all sharp
and flat notes.)

* The format should be versitile enough for use in traditional
"Compositional" software applications.. that is, where the music is
entered via a musical staff, complete with notes and other units of
traditional musical notation, as well as equaly useful in Sequencing
or "Tracker" style software, where the musical notes are entered
via the computer keyboard, or an electronic synthesizer connected via
a MIDI (or other) interface.

* The format should be as flexible as MIDI with respect to timing. (more
about this later)

* The format should have a "Compact" (but not compressed) version of itself,
where the musical information is stored in such a way that no space is wasted.
There wont be much reason for programmers to use the new format if songs
stored in it tend to take up 30% more disk space than, say, traditional
ProTracker format! A song should never be, by default, compressed.
Compression technology changes all the time, as well as adds a new level of
complexity to the format specification and to programmer's efforts to
```

implement a format. Compression should *always* be up to the user.
Some modems transfer uncompressed files better than compressed ones,
and some systems play uncompressed files faster than compressed ones.
Obviously, this does not apply to songs stored inside games or demos,
which might be compressed for security or space-saving reasons, but remember
that it's still sometimes better that the user of the program gets to decide
to compress a program or not.

* There should be some indication of the "Compatibility level" of the song.
That is, certain features, effects, and numbers of sound channels should
be limited if it is indicated that the song was origionaly created on
a Commodore-64, a Macintosh Classic, an Amiga 1000, an IBM 286 with an
AdLib card, etc. In this case, the song may only have 3 or 4 sound channels,
8-bit/11kHz sampled musical instruments, and a limited number of effects,
(if it has any at all) so it will always play on these systems.
It's possible there should be a set of "Levels" of compatibility, indicated
in the file: Level I = 1-4 channel song with limited effects, Level 2 =
1-6 channel song, Level 3 = 1-8 channel song, Level 4 = 1-16 channel song
with CD-quality Sampled Instruments, and so on. It should be remembered
that what makes a song "good" is not neccesarily the hardware involved,
but the skill, imagination, and inspiration of the composer. Also, the more
systems a song can be played back on, the more people who can enjoy the music
around the world.

* The format should be structured in such a way that it is reletivly easy
to translate from other module formats to this one.. and back. Thus it
should be perfectly possible to translate a 15-instrument 4-voice Amiga Sound
Tracker file to a "Level 1" version of this new format, and then back
again, with no change in quality or file size. Not only that, but it
should be possible to take a simple 1-4 track song and then "upgrade" it
to "Level 5" and add new effects and such, as well as "degrade" a Level
5 song to Level 1, where the composer can decide what effects and
music tracks to leave out... this of course depends on the music
composition software, and not the format exclusivly.

* Adiquite space should be given for the Author name, version of the song,
date the song was written, copyright/shareware/Public Domain message, and
some general information about the song. This should be seperate from
the "Instrument Name" strings section, though it might also be optional
that such a "Comment" section exist at all, as it may add unwanted overhead
to the file size.

* It might be possible for the Module to be stored as a "Song".. that is,
the note information, but not the instrument samples. (Only their
respective names.)

* It might be possible to have more than one song stored in a single
module file at a time. Each song should be able to have it's own speed and
overall volume associated with it, if different from the others.

There are a few issues that may need to be resolved. For one thing, is
a "track" actualy representative of a seperate instrument, or a seperate

sequence of musical notes? A single piano can, in theory, have more than one sequence of notes associated with it, since the player can use two hands, or two people can be playing the same piano at once, thus giving up to 4 seperate sequences of simultanious musical notes to the same physical instrument!

And timing.. while timing in video game and techno music is naturaly very exact and presice (electronic drum machines and such), "Real" music that the human ear is used to does not have such exact timing. This "exact" timing can sound mechanical and repeditive. Serious attention should be given to this issue.

Often, music origionaly composed with one program and played with another, (possibly a different hardware platform) will tend to sound different. Several differences include the speed of the overal song, the pitches of the respective notes, the timbre of the notes, and the length of the individual notes, as well as the absence of certain effects on the notes. There should be some "objective" or "hard-coded" reference points to make it easy for programmers to get very exact results from the same musical data but on different systems. Music from a C-64 or Amiga 500 always has it's own destinctive overall tone to it, because of the specific sound hardware. The user should have the choice of playing a tune back exactly the same origional way, or in a way most optimal for the advanced sound hardware they might posess.

The musical format should be flexible enough so that on one hand, people with a minimal understanding of music can use it to write and play songs, while on the other hand, people with a full understanding and expertise in music can be unrestrained and fully satesfied with the capabilities of the file format. The Amiga's IFF FORM SMUS, for example, is a relatively simple music format.. compared to the MIDI (.MID) file format, which is more complicated, arbitrary, and harder to understand, except by a musical expert. This is both a strength and a weakness.

It's very important that the musical format is as flexible and favorable to the user as possible. The user should not be forced to upgrade their hardware, or envy another platform altogether, in order to enjoy some music. It benefits everyone that as many systems and configurations as possible can support a musical format, so that the business of getting the music to play is trivial, and the business of producing and sharing the best music possible with everyone is the main activity. Over the last decade there have been hundreds of different musical applications producing thousands of imaginative and inspiring songs for video games, graphics & sound demos, and personal projects. It's time we started going back and "digging up" these hidden treasures out of our old piles of computer disks. I wouldnt be suprised if some of the most impressive computer songs were produced by a skilled musician in 1985 on an Apple II or Commodore-64 with Electronic Arts music software, just waiting to be enjoyed once more!

Jamal Hannah <jamal@gnu.ai.mit.edu>

Please contact me if you have comments, additions, or are working on a "universal" music file format yourself.

Appendix A: Some People Working on Advanced Music Formats

As of early 1994, There are several advanced module format projects in existance that I know of. This is likely to change.

Anyway, here are the projects/formats that I know of:

"IFF FORM TRKR" - Darren Schebek <dschebek@outb.wimsey.bc.ca> is working on this format which he has submitted to Commodore. Currently, I've seen the 1st version of his proposal, but not the second. This is still only in the proposal stage, and has not been fully implimented or completed yet. If you get no response from Darren, send Email to his sysop, Roger Earl <rog@outb.wimsey.bc.ca>.

"IFF FORM MODL" - Tom "OutLand" Bech of the Amiga group "CryptoBurners" <db62@hp825.bih.no> outlined a proposed "chunky" version of the ProTracker format in the archive for the Amiga's "ProTracker" version 3.01 beta. It still seems to be in the proposal stage, though ProTracker seems to be up to version 3.15 by now. Martin "Leviticus" Blom <lcs@lysator.liu.se> has submitted his own, enhanced version of IFF FORM MODL to Tom.

"IFF FORM EMOD" - Calle Englund <c92caren@und.ida.liu.se> and Bo Lincoln created this "chunky" version of the Amiga NoiseTracker format for their Amiga program "QuadraComposer" version 2.0. It's complete and described in the Manual for QC 2.0.

"IFF FORM STrk" - Frank Seide <seide@pfa.philips.de>, author of the excellent Macintosh program "Sound Trecker" version 2.0 would like to produce this format for his program. I dont have any information on this format yet.

"AMF" - Otto Chrons <c142092@cc.tut.fi> author of the IBM program "DMP" and "DSMI" has created the "Advanced Module Format" for his program. It handles 16 channels (at least) and is supposed to be very versitile. Otto is very hard to reach, and busy in the military in his country, but you might try contacting Andrew James Bromage <bromage@mundil.cs.mu.oz.au> for information about the format, as well as, possibly, a newer format supersceeding AMF. I dont have any structural information about the AMF format yet.

"UltraTracker" - Marc A. Schallehn <mas@doit.fido.de>, author of "Ultra-Tracker" version 1.50 for IBM's with GUS (Gravis UltraSound) cards has developed this 32-voice format. Michael J. Sutter <freejack@shell.portal.com> has documented the format well, and translated the German documentation.

"S3M" - The S3M format is from the IBM's "ScreamTracker" version 3.0, though I dont know if versions of the program are available beyond 2.0 (which produced "STM" and "STS" files). This format supports up to 32 voices, works best with a SoundBlaster Pro card in an IBM, and was made most popular by a Demo group called "Future Crew", who produced some really

wonderful pieces of (techno) music in their demos. A little more information
on this format may be needed to write an adiquite player, but I have
included some documentation on the format in this file.
(The best IBM player for S3M files seems to be DMP version 2.82)

"QuickTime" - I just recently read an announcement from Apple that
the new QuickTime multimedia specification (version 2) which will be
available in mid-1994, will include a compact music format. I dont have
any more information about this format at this time.

Some Relevant Individuals:

Antoine Rosset <rosset@cultnet.ch> is interested in producing his own
advanced music file format for his Macintosh program "The Player Pro",
currently at version 4.10. The Player Pro is pretty much the only
music module _editor_ for the Macintosh to date. I don't have any info
about Antoine's special format yet.

Harald Zappe <zappe@gaea.sietec.de> is interested in all music module
formats and (when he has time) helping people on all platforms get
information about computer music. He posts frequently on
alt.binaries.sounds.music (a very good newsgroup. comp.sys.amiga.audio
is another good USENET newsgroup to subscribe to.)

Bryan Ford <baford@schirf.cs.utah.edu> wrote Amiga MultiPlayer, interested
in supporting many module formats in his program.

Peter Kunath <kunath@informatik.tu-muenchen.de> wrote Amiga "DeliTracker",
a very versitile program that plays many, many Amiga music module
formats.. even some really obscure ones meant only for certain games.

Marco van den Hout <M.f.C.vDnHoUt@kub.nl> is very interested in advanced
module formats and is collecting information on them.

Appendix B: Some Advanced Music Format Specifications

I'm including information relating to 6 different file specifications:

IFF FORM TRKR
IFF FORM MODL (Tom Bech proposal)
IFF FORM MODL (Martin Blom Proposal)
IFF FORM EMOD
UltraTracker 1.5
ScreamTracker 3.0

Each section ends with a 78-character-long row of "=" (equal sign) symbols.

IFF FORM TRKR

>Date: 21 May 93 01:45:56 PDT
>Organization: Wizard Online

Hi. I'm the one whose been working on the IFF FORM TRKR document. Since I'll be losing my usenet access for an underterminate period of time, I'd thought the last thing I could do here is explain myself. :)
..

I have been working on this IFF FORM TRKR for almost a year now. I have sent the original draft proposal to Commodore, and they have included it in their latest IFF_FORMS document as a proposal. The current technical specification is in excess of 180K, and is about 70% complete as of this time.

I have also written player code that supports the format fully. This code is about 90% written, and still requires debugging and honing. All of the code has been written completely from scratch in assembly language (I even recalculated all lookup tables). I will also be writing load & save routines to go with the player code. All of this code is meant to accompany the IFF FORM TRKR document, and it will be public domain.

The player code is very organized, and very well commented. It is also optimized to a point that sustains readability and comprehension. I'm sorry, but I'm just a little tired of seeing player code accompanying some new release of a tracker editor that has the excuse "This code is not optimized in any way" at the top. Such player code is very badly written and completely convoluted. Code that is not optimized is one thing, but code in this state is inexcusable.

The player code will support n-octave 8SVX instruments, and will (hopefully, it all looks good on paper) support playing instruments from fast memory as well as chip memory.

I have redesigned the structure of a note event. It is still a longword, but now supports 127 note range, up to 63 commands, up to 63 instruments, and contains a 13-bit operand field. This has allowed me to enhance many commands.

I will list the commands that FORM TRKR supports here. Upward compatibilty with older tracker file formats is maintained. An existing tracker file that is converted to FORM TRKR can always be converted back to that format. Here are the commands (be aware that this list is unofficial and may change):

Arpeggio ([basenote] [,secondnote] [,thirdnote] [,rate] [,direction])
Arpeggio II (same as Arpeggio, but restarts the sample.
Pitch Slide ([,signedamount], mode) mode=0 once only, 1=every tick
Tone Portamento (destnote [,rate])
Tone Portemento II (destnote, progessionmode [,time])
progressionmode: 0=exponential pitch, 1=linear pitch
Tone Portamento + Volume Slide (destnote [,rate] [,signedvolamount])
Vibrato ([frequency] [,amplitude] [,wavetype])
wavetype: 1 = sine wave
2 = ramp up
3 = ramp down
4 = triangle
5 = square wave
6 = noise wave (pseudo-random)
Vibrato+Vol. Slide ([freq] [,wavetype] [signedvolamount])
Volume Slide ([signedamount])
Volume Portamento (destvolume [,time])
Tremolo ([freq] [,amp] [,wavetype]) wavetype same as vibrato.
Set Channel Volume (volume)
Set Parameters I ([glissando] [,filter] [,tremoloamp] [,vibratoamp])
Restart Note ([initialdelay] [,restartrate])
Cut-off Note ([cutoffdelay])
Set Fine Tune (finetuneval)
Sample Offset (offset)
Pause Voice (time)
Pause Music (time)
Set Marker (markerID)
Repeat From Marker (markerID, numiterations)
Set Ticks Per Minute (numticks) Replaces meaningless "BPM"
Set Ticks Per Note (numticks) Replaces SET SPEED command
Set Time Signature (numerator, denominator)
Set Beats Per Minute (numbeats) This is REAL beats per minute.
Set Notes Per Beat (numnotes) Used with Set Beats Per Minute.
Signal Task(s) (signalcode)

Those, very very briefly are the commands supported so far. I have included commands for defining a beat as well as a time signature so that it may be possible to render FORM TRKR music in sheet music format using standard music notation.

FORM TRKR supports n-voice (aka channel) songs. It can be used for songs with any number of voices, from 1 to ??.

I would like to state my ambitions here. After completing the technical specification and player code, I intend to write a conversion program for Protracker/Noisetracker and Soundtracker v2.6. Following that, I intend to develop (with a colleague of mine) a FORM TRKR datatype, as well as a fully

window-oriented music editor.

..

Any comments on this format are welcome. I am losing my usenet access, so
please direct comments to Roger (he cross-posted the nine messages). he will
make sure I get them. Thank you for reading this.

I would lastly like to add that one of the cross-posted messages talks about
the problems inherent with portamento the way it's traditionally handled by
most (if not all) tracker players. It offers an example of the time taken to
complete portamento operations in different octaves using the same notes.
Yes, the example given has an incorrect result, but you get the general idea.
:)

IFF FORM MODL (Tom Bech proposal)

<From "PT-Fileformat.doc" in the ProTracker 3.01b archive. -JH>

Introduction.
=============

The text below was intended to be the documentation on the fileformat used
in this release of ProTracker. However, we decided to wait with the actual
implementation of the format until having released a couple of versions,
because we'd like to hear some comments, suggestions etc. upon it first.
So read it lightly, and feel free to post your opinion to one of the authors
(see the ReadMe.doc file elsewhere on the disk). Note that since this is only
a suggestion, don't start programming a revolutionary new piece of code based
on this info yet; we may change the format :)... Here we go...

- Signed Tom "Outland" Bech of CryptoBurners.

-**-

Protracker release 3.01 Beta. Fileformat documentation.
===

This document includes the complete documentation of the fileformat used in
Protracker 3.01�, and instructions on how to use it. Fields marked "*Reserved*"
are reserved for future use and are guarantied to cause hangup if messed with.

General

With this release of Protracker we have decided to change the filestructure
of the musicfiles produced with the program. We felt the old format was
too obsolete, messy and out of date for us to use any further. So we invented
this new format. The format is based upon Interchanged File Format (IFF)

chunks, originally developed by Electronic Arts, but now in widely use on the Amiga. The format allows considerable flexibility and does not suffer too severly from changes and updates, and is therefore perfect for our use.

The Format

We will in this section introduce and describe each chunk type appearing in a Protracker music file. Look in the next section for the sequencial description.

** Contents of Chunk "VERS":

OFFSET Length Contents Meaning
---
0 4 "VERS" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 2 ???????? Version number (word).
10 6 "PT3.01" Version ID string.

This chunk is used by Protracker to identify the producer of the module, and if necessary perform upgrade-conversion if the file was made with a previous version of Protracker. There can be at maximum one "VERS" chunk in a Protracker music file. This chunk is not critical; it may be obmitted, but be aware of the possible incompatibility problems that may arise if it's left out.

** Contents of Chunk "INFO":

OFFSET Length Contents Meaning
---
0 4 "INFO" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 32 [..??..] Song name (string).
40 2 ???????? Number of instruments (word).
42 2 ???????? Number of positions (word).
44 2 ???????? Number of patterns (word).
46 2 ???????? Overall volume factor (word).
48 2 0006h Default speed (#VB) (word).
50 2 ???????? Packed field. See below.

Protracker uses this chunk to set different internal variables, and to store vital information used in replay and processing of the file. The song name is a maximum 32 Chars long ASCII string. It need not be NULL-terminated. Number of instruments indicates the number of instruments used in the song, it may range from 0 to 65535. At present version number, however, there may be maximum 255 instruments in one song. Number of positions reflects the actual length of the song, that is; how many patterns that will be played during a complete cycle. This number may vary from 0 to 65535. Number of patterns, on the other side, reflects how many _different_ patterns that will be played during the song. This number is used to calculate the total length (in bytes) of the song. The Overall Volume factor is used to compute the final volume

of all channels after the individual channel-volumes have been figured out.
In this way it is easy to control the loudness of the music from the program/
song itself. Default speed is the number of VBlank frames between each pattern
position change, and is as default set to 0006h. The packed field consists
of these bits (right to left order):

Bit Meaning 0 1 Default
---
0 Filter flag. Filter off. Filter on. 0
1 Timing method. VBlank. CIA timing (BPM). 0
2 File type. Module. Song (no instruments). 0
3 Packstatus. Packed patterns. Raw patterns. 1
4 Length flag. Equal pattern length. Variable pattern length. 0
5 Voices flag. 4 voices. 8 voices. 0

There can be at most one "INFO" chunk in a Protracker musicfile. This chunk is
vital; it _must_ be present for the replay routine to function properly.

** Contents of Chunk "INST":

OFFSET Length Contents Meaning
---
0 4 "INST" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 32 [..??..] Instrument name (string).
40 2 ???????? Length of instrument (word).
42 2 ???????? Instrument loop start (word).
44 2 ???????? Instrument loop length (word).
46 2 ???????? Instrument volume (word).
48 2 ???????? Instrument finetuning (integer).

The "INST" chunk is used to store information about an instruments properties,
such as length and volume. The instrument name is a maximum 32 Chars long ASCII
string. It need not be NULL-terminated. The Length field describes the length
of the instrument (in words) and thus ranges from 0 to 128Kb (65535 words).
Instrument Loop Start sets the offset from which to start playing after the
first replay. This value may vary from 0 to the instrument length. Instrument
Loop End sets the length of the loop to play after the first replay, relative
to the loop start value. It may thus vary from 0 to [Ins_len-Loop_start].
Instrument volume indicates which volume to use in the replay of the sample,

if the song doesn't say differently. This value varies between 0 and 40h.
Instrument finetuning sets the sample-rate correction difference and varies
from -7 to 7 (0fff9 to 0007h).
There may be any number of "INST" chunks in a Protracker music file,
limited to the number of instruments actually used in the song. This
chunk is not vital; it may be left out if the song-only bit of the control
word in the "INFO" chunk is set. Otherwise, it should result in an error.

** Contents of Chunk "PPOS":

OFFSET Length Contents Meaning
---
0 4 "PPOS" Chunk identifier.
4 4 0ffh Chunk length (in bytes).
8 256 [..??..] Pattern position table.

This chunk contains the table defining which pattern to play in a given song-
position. Each entry in the table is a byte indicating which out of 256
possible patterns to play. There may be at maximum one "PPOS" chunk in a
Protracker musicfile. This chunk is vital; it _must_ be present to play the
song.

** Contents of Chunk "PTRN":

OFFSET Length Contents Meaning
---
0 4 "PTRN" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 32 [..??..] Pattern name.
40 ? [..??..] Pattern data.

This chunk is used in a module of variable pattern length. The chunk must thus
appear as many times as there are patterns in the song. The chunk length divided
by 8 (>>3) will show the pattern length (default 64). Pattern name is a 32
byte long ASCII string, describing the pattern, eg. "Intro part 3". It need not
be NULL-terminated. This chunk is critical; it must be present in the file, or
it will be regarded invalid. NOTE: This chunk is not in use in the present
version (3.01B), and will be ignored if found.

** Contents of Chunk "SMPL":

OFFSET Length Contents Meaning
---
0 4 "SMPL" Chunk identifier.
4 4 ???????? Chunk length (!in bytes!).
8 ? [..??..] Raw sample data.

The "SMPL" chunk contains the raw sample data of an instrument. This chunk is
not critical; if the song-only bit of the "INFO" chunk is set, it may be
obmitted. If, however, the file is a module, then the number of "SMPL" chunks in

the file must be equal to or greater than the number of instruments used in the song. If not, the file will be regarded incomplete.

** Contents of Chunk "CMNT":

OFFSET Length Contents Meaning
---
0 4 "CMNT" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 ? [..??..] Raw ASCII text.

The "CMNT" chunk is used for a signature, comments, greetings, date of completion or whatever information the composer wishes to include with his or hers creation. This chunks is not critical; it may be left out and will typically be ignored by most applications.

These are the chunks that may appear in a Protracker musicfile. If other chunks are encountered, they will be ignored. Any program dealing with this fileformat should perform tests to determine the validity of the file in consideration. Using the Protracker.library will guarantee correct handling of musicfiles, and we strongly encourage the use of this runtime shared library instead of hacking away on your own. Look elsewhere on this disk for the library documentation, the library can be found in the "LIBS/" directory.

The sequential format

In this section we will describe how the various chunks are expected to be located within the file. These rules _must_ be followed or it will wreak havoc when tried manipulated with inside Protracker. Here comes the header in table form:

OFFSET Length Contents Meaning
---
0 4 "FORM" Indicate start of IFF file.
4 4 ???????? File length.
8 4 "MODL" IFF type identifier.

This header must be found in the start of the file, or it will be rejected as not being a Protracker musicfile. From offset 12 in the file, things may vary somewhat. The only rules are these: After a "INST" chunk a "SMPL" or a new "INST" chunk _must_ follow. This "SMPL" chunk will be regarded as the sample data of the instrument(s) preceding it. If after a "INST" chunk another "INST" chunk follows, and the module-flag in the "INFO" chunk is set, then all "INST" chunks following each other will share the same sampledata found in the first "SMPL" chunk after them. Also, all "INST" and "SMPL" chunks must be found in sequence. That is, when a "INST" chunk is found for the first time in a file, all other "INST" and "SMPL" chunks must follow. If this is not so, an error message should be given, and processing terminated. Note that in a song-only file, no "SMPL" chunks should be included. If any "SMPL" chunks are encountered in such a file, they should be ignored and a warning given. All other chunks

used in a musicfile may be located anywhere in the file, usually in the beginning of it, but no assumptions of their locations should be taken. Note that all used chunks _must_ be found _before_ the "BODY" chunk, which is the last chunk to be found in the file. Searching for chunks should stop when encountering a "BODY" chunk. The "BODY" chunk is constructed like this:

```
OFFSET Length Contents Meaning
------------------------------------------------------------------------------
0 4 "BODY" Chunk identifier.
4 4 ???????? Chunk length (in bytes).
8 ? [..??..] Raw pattern data.
------------------------------------------------------------------------------
```

Chunk summary

Now follows a list of the chunks that have meaning in a Protracker musicfile:

```
Chunk Function Critical?
------------------------------------------------------------------------------
"VERS" Contains information about the producer of the file. No
"INFO" Contains vital information and standard settings. Yes
"INST" Information about instruments; such as length, volume etc. Yes
"SMPL" Raw sample data associated with one or more instruments. No
"PPOS" Position table. Information about patternsequence. Yes
"CMNT" Comments, greetings etc. Contains information in ASCII code. No
"PTRN" Pattern data. Used only in modules of varying patternlengths. Yes
"BODY" Pattern data. Used in modules of equal patternlengths (default). Yes
------------------------------------------------------------------------------

/* End Of File */

IFF FORM MODL (Martin Blom Proposal)

<From an email message I recieved from Martin Blom -JH>

```
Date: Thu, 10 Feb 1994 12:27:05 +0100
From: lcs@lysator.liu.se
Message-Id: <199402101127.MAA26288@robin.lysator.liu.se>
To: jamal@bronze.lcs.mit.edu
Subject: Re: IFF FORM MODL, (IFF MODULE FORMATS)
Newsgroups: comp.sys.amiga.audio
References: <2j3ojs$h2k@bronze.lcs.mit.edu>
Status: RO

In comp.sys.amiga.audio you write:

>Is the specification for "IFF FORM MODL" which was described in PT301b's
>documentation still being worked on? Does anyone know? And if so,
>who would I contact for information about it?
```

>There are a couple IFF "chunk" Module file Formats being worked on
>right now, one being "IFF FORM TRKR", and it would be nice to
>coordinate all efforts towards a single, versitile IFF mod format.
>(or at least make the different ones somehow compatible.)

> - Jamal Hannah (jamal@gnu.ai.mit.edu)

Hi! A couple of days ago, I sent my suggestion of the IFF-MODL format to
Tom "Outland" Bech, however I have not got an answear yet. In order to
coordinate all work, I think it is important that everyone with an interest
in the IFF-MODL standard should have regular contact. Anyway, here follows
my proposition. Comment it, please!

/Martin

This is my version of the new IFF MODL format. I love the idea of using IFF for
modules in the future. However, the format you have proposed is, IMHO, far too
hardware and Protracker specific. Please comment everyting you don't like (and
everything you do like, too!). Ok:

IFF MODL format.

A IFF file can contain these chunks:

Name # Desc

FORM MODL 1-n A file can contain many modules.
CSET 0/1 Character set. See RKRM-Devices.
NAME 0/1 Module name. See RKRM-Devices.
AUTH 0/1 Author of module. See RKRM-Devices.
(C) 0/1 Copyright notice. See RKRM-Devices.
ANNO any Annotations. See RKRM-Devices.
FVER 0/1 Version string. See RKRM-Devices.
MHDR 1 Module header. Info about the mod.
CAMG 0/1 Amiga specific info.
TPOS # of sound channels Track sequence info.
NTRK # of note tracks Note track. (Pattern, 1/channel).
ETRK # of effect tracks Effect track.
FORM 8SVX # of samples Sample data.
GPID 1 Group ID.
....and any other 8SVX chunks.
FORM INST # of instruments Instrument info.
CSET 0/1
NAME 0/1
AUTH 0/1
(C) 0/1
ANNO any
FVER 0/1
IHDR 1 Instrument header. Simular to VHDR.
ATAK 0/1 Attack. See RKRM-Devices.
RLSE 0/1 Release. See RKRM-Devices.
PAN 0/1 Panning. See RKRM-Devices.

... More effect information.
... More module information.

Description of nonstandard chunks. (C-format (I think. I only know asm..)).

FORM MODL - music MODuLe
~~~~~~~~~
A module can contain the chunks lised above. The MHDR, TPOS, NTRK, ETRK and
FORM INST chunks are vital, they must exist. The MHDR contains various info
about the module, TPOS contains the actual track sequence for each channel
(that is, the notes are stored in tracks, NOT patterns.), NTRK and ETRK is the
actual tracks, containing notes and effects. This was split up because
a) the format allows only one note/track, but many effects.
b) Often, you have more notes than effects, and since effects needs more space
to store, the overall size will (hopefully) be smaller.
A FORM MODL chunk also contain other FORMs, for now FORM 8SVX and FORM INST.
This makes the FORM MODL a bit more complex, but a lot more flexible.

All includes FORM 8SVX shuld contain a GPID chunk. A field in the IHDR chunk
inside FORM INST is refering to a sample number, and the GPID contains the
sample number. Because of this, the order that the sample and instrument FORMs
come in is not important. This also allows futures enhanchmens such as 16 bit
samples or MIDI sounds. Even if a player don't support 16 bit samples the
player will be able to locate the number of all samples it DOES support.

FORM INST - INSTrument
~~~~~~~~~
A instrument FORM contains information for a instrument. Only one chunk is
vital, the IHDR chunk, but one will probably include at least a NAME chunk too.
In this FORM, a lot of effect chunks can be saved. All effect chunks that a
8SVX can contain can be used here to. All information in this FORM has priority
over the same info in (f.ex.) a 8SVX FORM. The actual instrument is split up in
two chunks (FORM INST and FORM 8SVX for now) because you may want to use the
same sample (8SVX), but with different effects and volume, for many
instruments.

GPID - GrouP IDentification number
~~~~
typedef struct {
UWORD id ID number.
} GroupID

MHDR - Module HeaDeR
~~~~
typedef struct {
Fixed volume Overall volume. 0-65536 (0-1.0)
UWORD tempo tempo in 1/128 BPM.
UWORD ctInst # of instruments.
UWORD ctSamp # of samples.
UWORD ctTrack # of tracks.
UBYTE ctChannel # of voices/channels. (4 on Amiga.)
UBYTE speed ST/PT/NT speed, VBL delay.

} ModuleHeader
*** 'Fixed' is defined as ULONG in the IFF includes.

CAMG - Commodore AMiGa info
~~~~
ULONG flags bit 0: 0=filter off, 1=on
bit 1: 0=VBL timing, 1=CIA

TPOS - Track POSitions
~~~~
typedef struct {
UWORD channel play this track which channel?
UWORD track[] sequence of track numbers.
} TrackPos

NTRK - Note TRacK
~~~~
typedef struct {
structure Noteinfo[] Sequence of Noteinfo structures.
} NoteTrack

typedef struct {
UBYTE nEv Note Event.
1-126: MIDI note
128: Pause
UBYTE data1 Length in 1/128 notes, high byte
UBYTE data2 low byte
} Noteinfo

ETRK - Effect track
~~~~
typedef struct {
structure Effectinfo[] Sequence of Effectinfo structures
} EffectTrack

typedef struct {
UWORD effect Effect number.
UWORD data Data for effect.
UWORD length Length in 1/128 notes.
} EffectInfo

IHDR - Instrument HeaDeR
~~~~
typedef struct {
Fixed volume Instrument volume, 0-65536 (0-1.0)
UWORD instrument The number of this instrument
UWORD sample Use sampledata from which sample?
BYTE finetune Finetune data, -8 - 7
UBYTE tune Sample is tuned as..? MIDI tone.
} InstrumentHeader
*** 'Fixed' is defined as ULONG in the IFF includes.

That's it! Hope to hear from you soon.
~~~~

==========

IFF FORM EMOD

<From the text-file manual from QuadraComposer 2.0. Two of the effects in
this format are said to differ from the standard NoiseTracker format's
effects. These are the "SET SAMPLE OFFSET" and "POSITION JUMP"
effects commands. The Manual lists all commands, im just including the
format outline from the very end of the file. -JH>

The standard EMOD fileformat is using the standard IFF (not
SMUS!) format. It was necessary to create a new fileformat, to be able
to include all the new features (compared to the NT-fileformat), like:

* 255x128 kb samples.

* 256x256 rows named patterns.

* 255 positions.

* Better internal format for pattern data - 4 bits left per note
for future expansion.

The patterndata is put in the file row by row, 4 bytes for each
note, and 16 bytes for each row:

```
SampleNr NoteNr Empty Effect
cmd.
-------- -------- ---- -------------
00000000 00000000 0000 0000-00000000 <--- Bits
-------- -------- ---------- --------
Byte 0 Byte 1 Byte 2 Byte 3
```

The notenumber is a number from 0 to 35 which corresponds to a
note (C 1 to B 3). To get the period you'll have to use a list. The following
are the IFF chunks of the EMOD fileformat. If you want to add something
new to the module like a long comment or a text, please make a new
chunk. A properly made program should just ignore the unknown chunks.

```
Type Size Description

================================================================================

UltraTracker 1.5
----------------
<From the IBM "ultra150.zip" archive by Marc Schallehn, text file by
Muchael J. Sutter and update comments added by Marc Schallehn. -JH>

Mysterious's ULTRA TRACKER File Format
by FreeJack of The Elven Nation
(some additional infos on the new format (V1.4/5) by MAS -> * marked)

I've done my best to document the file format of Ultra Tracker (UT).
If you find any errors please contact me.
The file format has stayed consistent through the first four public releases.
At the time of this writting, Ultra Tracker is up to version 1.3
(* With version V1.4/5 there are some changes done in the format. *)

Thanks go to :
SoJa of YLYSY for help translating stuff.
```

Marc Andr Schallehn
Thanks for putting out this GREAT program.
Also thanks for the info on 16bit samples.

```
With all this crap out of the way lets get to the format.

Sample Structure :

--------------------------------------------------------------------------------
Samplename : 32 bytes (Sample name)
DosName : 12 bytes (when you load a sample into UT,
it records the file name here)
LoopStart : dbl word (loop start point)
LoopEnd : dbl word (loop end point)
SizeStart : dbl word (see below)
SizeEnd : dbl word (see below)
volume : byte (UT uses a logarithmic volume setting, ranging from 0-255)
(* V1.4: uses linear Volume ranging from 0-255 *)
Bidi Loop : byte (see below)
FineTune : word (Fine tune setting, uses full word value)
--------------------------------------------------------------------------------

8 Bit Samples :
```

SizeStart :
The SizeStart is the starting offset of the sample.
This seems to tell UT how to load the sample into the Gus's onboard memory.
All the files I have worked with start with a value of 32 for the first sample,
and the previous SizeEnd value for all sample after that. (See Example below)
If the previous sample was 16bit, then SizeStart = (Last SizeEnd * 2)
SizeEnd :
Like the SizeStart, SizeEnd seems to tell UT where to load the sample into the
Gus's onboard memory. SizeEnd equal SizeStart + the length of the sample.

Example :
If a UT file had 3 samples, 1st 12000 bytes, 2nd 5600 bytes, 3rd 8000 byte.
The SizeStart and SizeEnd would look like this:

Sample SizeStart SizeEnd
1st 32 12032
2nd 12032 17632
3rd 17632 25632

Note
Samples may NOT cross 256k boundaries. If a sample is too large to fit into the
remaining space, its Sizestart will equal the start of the next 256k boundary.
UT does keep track of the free space at the top of the 256k boundaries, and
will load a sample in there if it will fit.
Example : EndSize = 252144
If the next sample was 12000 bytes, its SizeStart would be 262144, not 252144.
Note that this leaves 10000 bytes unused. If any of the following sample could
fit between 252144 and 262144, its Sizestart would be 252144.
Say that 2 samples after the 12000 byte sample we had a sample that was only
5000 bytes long. Its SizeStart would be 252144 and its SizeEnd would be 257144.
This also applies to 16 Bit Samples.

16 Bit Samples :
16 bit samples are handled a little different then 8 bit samples.
The SizeStart variable is calculated by dividing offset (last SizeEnd)
by 2. The SizeEnd variable equals SizeStart + (SampleLength / 2).
If the first sample is 16bit, then SizeStart = 16.
Example :
sample1 = 8bit, 1000 bytes
sample2 = 16bit, 5000 bytes

sample1 SizeStart = 32
SizeEnd = 1032 (32 + 1000)

sample2 SizeStart = 516 (offset (1032) / 2)
SizeEnd = 3016 (516 + (5000/2))

Note
If a 16bit sample is loaded into banks 2,3, or 4
the SizeStart variable will be
(offset / 2) + 262144 (bank 2)
(offset / 2) + 524288 (bank 3)
(offset / 2) + 786432 (bank 4)

The SizeEnd variable will be
SizeStart + (SampleLength / 2) + 262144 (bank 2)
SizeStart + (SampleLength / 2) + 524288 (bank 3)
SizeStart + (SampleLength / 2) + 786432 (bank 4)

BiDi Loop : (Bidirectional Loop)
UT takes advantage of the Gus's ability to loop a sample in several different ways. By setting the Bidi Loop, the sample can be played forward or backwards, looped or not looped. The Bidi variable also tracks the sample resolution (8 or 16 bit).

The following table shows the possible values of the Bidi Loop.
Bidi = 0 : No looping, forward playback, 8bit sample
Bidi = 4 : No Looping, forward playback, 16bit sample
Bidi = 8 : Loop Sample, forward playback, 8bit sample
Bidi = 12 : Loop Sample, forward playback, 16bit sample
Bidi = 24 : Loop Sample, reverse playback 8bit sample
Bidi = 28 : Loop Sample, reverse playback, 16bit sample

Event Structure:

Note : byte (See note table below)
SampleNumber : byte (Sample Number)
Effect1 : nib (Effect1)
Effect2 : nib (Effect2)
EffectVar : word (Effect variables)

The High order byte of EffectVar is the Effect variable for Effect1.
The Low order byte of EffectVar is the Effect variable for Effect2.
(Note)
UT uses a form of compression on repetitive events. Say we read in the first byte, if it = $FC then this signifies a repeat block. The next byte is the repeat count. followed by the event structure to repeat.
If the first byte read does NOT = $FC then this is the note of the event.
So repeat blocks will be 7 bytes long : RepFlag : byte ($FC)
RepCount : byte
note : byte
samplenumber : byte
effect1 : nib
effect2 : nib
effectVar : word

Repeat blocks do NOT bridge patterns.

Note Table:

---
note value of 0 = pause
C-0 to B-0 1 to 12
C-1 to B-1 13 to 24
C-2 to B-2 26 to 36
C-3 to B-3 39 to 48

C-4 to B-4 52 to 60

Offset Bytes Type Description

---

0 15 byte ID block : should contain
'MAS_UTrack_V001'

(* V1.4: 'MAS_UTrack_V002')

(* V1.5: 'MAS_UTrack_V003')

15 32 AsciiZ Song Title
47 1 reserved This byte is reserved and
always contain 0;

(* V1.4: jump-value: reserved * 32;
space between is used for song
text;
[reserved * 32] = RES !)

48+RES 1 byte Number of Samples (NOS)
49+RES NOS * 64 SampleStruct Sample Struct (see Sample Structure)

Patt_Seq = 48 + (NOS * 64) + RES

Patt_Seq 256 byte Pattern Sequence
Patt_Seq+256 1 byte Number Of Channels (NOC) Base 0
Patt_Seq+257 1 byte Number Of patterns (NOP) Base 0

(* V1.5: PAN-Position Table
Length: NOC * 1byte
[0 left] - [0F right])

NOC+Patt_Seq+258 varies EventStruct Pattern Data (See Event
Structure)

The remainder of the file is the raw sample data. (signed)

That should about cover it. If you have any questions, feel free to e-mail
me at freejack@shell.portal.com

861. HELP! Pascal problems! ***

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-12 08:09:18 UTC
From: umcordes@cc.umanitoba.ca
Message-ID: <2ji2re$d07@canopus.cc.umanitoba.ca>
Source record: 34294

Hi! I'm getting very frustrated with HighSpeed Pascal! I was wondering
if someone could recommend a better solution to my problem:

I have an array of records (56 bytes per record). The array is 2000
records long. Anyways, I want to be able to save/load the whole array. I
could always go thru saving each record one at a time (using write), but
this is SLOW. I want to write the whole sheebang in one go...

So, you say, why not just write the whole array with one write(my_array)
statement on a "file of my_array_type"? Well, that worked when I had an
array length of 1000...and it was very quick. BUT, now that I need 2000
records, it WON'T work. The reason (I figure) is because 2000 records *
56 bytes each = 112000 bytes (previously I was using 1000*56=56000 bytes).
Read and write seem (undocumentedly) to only be able to handle up to 65500
(whatever MaxWord is) bytes! Anything above MaxWord and the file is
happily written, except it turns out truncated!

Ditto with BlockWrite. It's parameters can only be integers.

So, I figure, why not save one half with one write statement and the other
half with another? Here's how I tried it:

```
size:=SizeOf(RcComp)*1000; # Get the byte size of a half
Rewrite (fcomp,datapath);
BlockWrite(fcomp,Addr(comp[1]),size,r1); # write half #1
BlockWrite(fcomp,Addr(comp[1001]),size,r2); # write half #2
Close (fcomp);
```

The compiler informs me blockwrite can't handle the "Addr(comp[1])" part
as I guess it doesn't like pointers (why?)!

So, I've tried everything I can think of. Anyone know a way that would
work, and would be faster than writing each individual record?

Thanks a ZILLION to whoever helps! :-D

Presumably, if the Amiga's got fairly standard (ie, UNIX) libraries,
you'd follow the same procedures that someone on a Sun or other
big-endian host would do.

I'm going to be writing up a cross-compiler how-to as soon as I get a
chance; keep an eye on comp.sys.atari.st.tech for the actual article.

> Has anyone got any hard info on the subject? (e.g. anyone who has
> upgraded the memory themselves should know.)

The CPU <=> RAM bus is 16-bits, the video <=> RAM bus is 32-bits.

I think.

The 16-bit bus is the main reason why a Falcon with a 33Mhz accelarator
is still a fair bit slower than a TT.

865. Serial speed

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-12 16:32:27 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <8hLEGPe00YUo0E81YO@andrew.cmu.edu>
Source record: 34298

I'm tied into our University network via a direct serial connection. I've been using Storm because it has the DOS graphical characters used by programs to simulate windows. When I try to run at 9600 or 19.2 baud, I start to loose characters on the screen. I tried running this fast in Connect, and there wasn't a problem, but as far as I know, Connect doesn't have the right character set to provide the nicer interface. Is there some way I can increase the buffer size in Storm (if that's the problem), or some way to set up Connect to use the right character set?
I have tried using the serial patches, but they didn't do anything. I don't think that's the problem, simply because Connect didn't have any problems receiving all the data. Also, there's no possibility of problems with a modem, because there is no modem, I'm basically using a null-modem cable.

Thanks,
David

I have an Atari Falcon which I use mainly for MIDI purposes but I have been thinking about getting th HP DeskJet 550C printer. I would lie to use it for tape cassette covers..... Does anyone have experience using the combination of the Falcon and the 550C? If so what are you opinions of drivers for best color quality? Opinions about best paper choices for rich colors? How is the banding problem when printing solid color, say, no bigger than 3"X5"?

Second, does anyone have any info regarding a DSP modem for the Falcon?

Thank you in advance,

Michael

870. TurboDOS not TurboST ???

>(if that's the problem), or some way to set up Connect to use the right
>character set?

Hallo David,

Connect does have the right character set. You did not tell me,
what kind of host you are accessing.

- Assuming it is a unix host with vt100 you shoud enter the
'CHARACTER SET' dialog and make the following changes:
- Character Set to vtxxx(ISO)
- Bank 0 American
- Bank 1 Graphics
- Keyboard 7Bit ISO
- Scantable : empty (no entry)
- Assuming it is a DOS host with PC-Ansi:
- Character Set : ATARI
- Keyboard IBM

In both cases you have to use another font (either connligh.fnt or
connect.fnt which are included in the archive). There are two ways
of installing them:

CoNnect uses GDOS fonts, but even without GDOS
you may use these fonts by putting them into a
directory named GEMSYS in your CoNnect directory.
CoNnect will load these fonts at start-up time if
no GDOS is installed.

To select this alternate font enter the DISPLAY dialog and
switch to CONNECT or CONNECT LIGHT.

I fetched it. It works. Unfortunately, under at least some circumstances,
a bad program being debugged is able to bring down the whole system. Also,
if there's a way to examine protected low memory locations I haven't found
it.

More a sign of my ignorance than a failing in the program, I'm sure: I
haven't found a way to divert the disassembly of a single function to the
printer, which would be useful.

Steve

I don't understand why you would get stack exhaustion failure; surely you
turned off stack checking in your interrupt service routines?! (And don't
keep calling me Shirley). The checker just compares the current SP with the
limit for the USP, in your interrupt routine it would be comparing the SSP,
and would likely fail).

Source record: 34311

Hi all,
A small technical question. I have a Mega ST4, and Atari, in their wisdom decided it did not need a composite video line. It does have HSync and VSync, (pins 9 nad 12). ST Internals says the composite line (2) is just the connection between HSync and VSync. Is this true, or do I need someting more to get a composite video signal. Replies here or by email.

Thanks in advance,
Peter.

879. Falcon030 and internal drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-14 06:32:31 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2jn5tv$n55@cxc1.cl.msu.edu>
Source record: 34312

Does anybody know what magic words have to be canted to get a Falcon
to boot from an external hard drive when the internal drive has
been removed? ICD's Pro Utilities keep telling me that none of
my hard drives (Maxtor 130meg and Syquest 44) support auto-booting
even tho they auto-booted just fine when I was using Pro Utils with
an ICD host...

The system boots only from floppy which, as you might guess, doesn't
cut it! About 80% of the time, ICD's bootup screen shows no drive
on device 16, but about 20% of the time it reports UNKNOWN DEVICE
after polling the non-existent drive.

I had this problem when I originally had a 1/0 Falcon030. get the new Pro utils, its at like 6.4.2 (or so, later then 6.2.4) and it fixes that autoboot problem. Use the Atari booter that came with the machine, it will work fine, just takes a while. Though sometiems teh IDE shows up as unknown too...

Does anyone know what the format of HiColour (15 and 16 bits) and
TrueColour (24 bits) VDI device-independent forms (MFDBs) is? The
Compendium describes the planar ones, up to 8 bits... and then stops!

Cheers,

Has anyone managed to do anything useful with the values returned from vqt_get_tables()? The docs blurble on about 7 arrays of 224 words, but all I get back is a single pointer... Is this 'short *' pointer really 'short [224][7]', or 'short [7][224]' (I suspect the latter)?

The pointer I get back is also font-independent. The entries in it do not seem to tally with any Bitstream indexes either...

Help, I'm confused!

TurboST was a VDI accelerator that isn't supported any more. See GDOS FAQ.

Hello folks,
Avery simple question (well I hope so...) :

What do I ned to have a stable working Gnu C compiler (and assembler
+ debugger) ?
My hardware: MEGA ST4, TOS 2.06 French, 85Meg harddisk, AHDI 5.00,
monochrome monitor.

Many thanks.

PS: this include a godd shell like TCSH.

>color quality? Opinions about best paper choices for rich colors? How is the
>banding problem when printing solid color, say, no bigger than 3"X5"?
Well, my experience is ST + 550c, rather than Falcon + 550c, but the
following should still apply:

DRIVERS:
. The PageStream driver for the 550c driver is not very good (in line with
the rest of PageStream!). You get a 500c driver with v2.2, but need
2.2b for the 550c. (Of course, a 500c driver can run the 500c, but
doesn't use the black cartridge, giving a big loss in output quality).
. GhostScript v2.6.1 has an *excellent* 500c driver. From PageStream, I
do quick prints direct to the printer, or better quality prints by
using the PostScript driver and GhostScript. The main difference
between the PageStream and GhostScript drivers is in the dithering
techniques; the latter gives MUCH better output in every printout that
I have compared.
. IMGCOPY2 has an OK driver, somewhere between GhostScript and PageStream
for quality.
. GDOS drivers for the 500 work fine, but in mono of course.

PAPER:
. I do normal printouts on 100gsm photocopier paper, and it works well.
Some absorbent papers give problems with colours soaking and spreading
before they dry (unlike the HP 1200c, the 550 does not have a heater to
dry the ink). Large areas of ink can cause this paper to crinkle a little
as it dries.
. Colour output on special HP glossy paper is absolutely stunning! But,
the paper costs a pound a sheet, so don't use it all the time!
. Given half-decent paper, there is practically no banding in the output.

Possibly st only, not sure about the Falcon:
Get a printer output patch program (FPRNT, if I remember correctly). It's
only a couple of hundred bytes long, and *greatly* speeds up printing.

Conclusion: It's a good buy! Some people would recommdend that you
also look at the Canon BJC600.

:> something different, but WHAT? Does it use some interleaved format? The
:> Crazy Dots vdi reports that there is a lookup table in this mode. Is
:> there some way to find out from the vdi what format is used?

The Crazy Dots does NOT have a CLUT in HiColor, but as the VDI cannot handle
more than 256 colors, it emulates one.
For the RGB informationn, there are two possibilities: MSB first or LSB
first. Check the Gemview docs for that.

Hahahaha !

Don't forget that the 030 only has 256 bytes of cache for instr and
same for data (total 512 bytes). It's ridiculous (but not useless,
don't get me wrong). Cache misses are much more frequent than you
imagine and given there isn't a second level cache, a cache miss will
take a long time (probably around 8 cycles, maybe more) which means
that even prefetching may not happen soon enough (I don't even
consider interesting situations such as prefetching after a jsr ?).
(actually the 030 doesn't do much prefetching at all)

And all the data cache misses will also take a long time. Of course ST
programs tend to use 16bits ints more than on other machines because
32bits were expensive on the ST, but still: your falcon is likely to
be much slower than any other 16Mhz 030 with 32bits bus. "much" will
probably be something like 1.8 times

Oh well, it wasn't designed for number crunching anyway and the rest
of the system is not that bad.

Stefan

Source record: 34325
Cross-posted to: comp.sys.atari.st,rec.music.makers.synth,comp.sys.atari.advocacy,comp.sys.atari.st.tech

I am looking for information on the current status of the BAREFOOT
SOFTWARE Company, who marketed Music Sequencing and Editing software
previously developed by HYBRID ARTS. The current phone numbers
for BAREFOOT are:

Voice: 818-727-7143
Midi BBS: 818-996-7659
FAX: 818-727-0632

For the past few years I have been using Stefan Daystrom's
"SMPTETRACK" professional music sequencing software with
SMPTE lock-up. I've finished moving and re-building my
studio and am looking to upgrade and add components to this
system. (Possibly upgrading my 1040 ST to a Falcon or ??, etc).

I have tried contacting the above three phone numbers and have received
"no answer", including no answering machine for the voice hotline.

What's the scoop ? Hopefully they have only suffered temporary
problems due to the recent earthquakes and will be back soon.

Any information would be appreciated.

Thanks,

Bob Neumann

I'm not sure what the answer to your question is, but I know that you
can find doc files describing how to build that which is needed to display
to a TV. I believe ftp.tu-clausthal.de and ftp.uni-kl.de both have doc
directories. One of them has the file I am thinking of.

Also, purchasing a Vidi-ST will do it. These were made by the same folks
that produced the Monitor Master and Mouse Master. I have seen them pop up
on the used market from time to time. I have seen one, and it appeared to
function just fine.

Hope that helps.

From what I can remember I used a XOR Gate to get a true composite sync, this
was used with a Amiga 500 modulator, all the parts from memory,
5 v Regulator etc, fitted inside the 23 Pin D Type connector case...

895. vro_cpyfm() - any fd_stand==1 implementations?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-15 06:17:42 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2jppe6$63u@uqcspe.cs.uq.oz.au>
Source record: 34328

Okay, provided I haven't scared everyone away with that cryptic subject...

As we all know, vro_cpyfm() doesn't support anything except device-dependent (fd_stand==0) copying. It doesn't translate. It doesn't do device-independent.

Of course, we can use vr_trnfm() to get from device-dependent (0) to device-independent (1), and hence:

```
SRC DEST
a 0 0 vro_cpyfm(SRC,DEST)
b 0 1 vr_trnfm(DEST,tmp); vro_cpyfm(SRC,tmp); vr_trnfm(tmp,DEST)
c 1 0 vr_trnfm(SRC,tmp); vro_cpyfm(tmp,DEST)
d 1 1 vr_trnfm(SRC,tmp1); vr_trnfm(DEST,tmp2); vro_cpyfm(tmp1,tmp2);
vr_trnfm(tmp1,SRC); vr_trnfm(tmp2,DEST);
```

But only (a) and (c) are palatable.

It should be pretty simple to write a "vro_cpystdfm()", since standard form is not VDI-specific [footnote: I suspect this is why they left it out in the first place]. Thus giving us:

```
SRC DEST
a 0 0 vro_cpyfm(SRC,DEST)
b 0 1 vr_trnfm(SRC,tmp); vro_cpystdfm(tmp,DEST)
c 1 0 vr_trnfm(SRC,tmp); vro_cpyfm(tmp,DEST)
d 1 1 vro_cpystdfm(SRC,DEST)
```

Much nicer.

Now, I'll probably start work on this pretty soon anyway (I'm desparately in need of it, because I have a (d) case with small SRC).

My primary concerns are:

- should I use the blitter if available?
- could I use the VDI's vro_cpyfm() to copy single-bitplanes (this would trivialize the code)

So. Anyone got some good ideas, or better yet, existing implementations?

Why? The VDI can only handle the concept of up to 256 *pens* (Ok, it
is a horrible kludge), but that's no reason to emulate a LUT in
HiColour ("HiColor" if you're American :-) or higher modes.

Is that Crazy Dots behaviour with NVDI-ET4000, or out-of-the-box?

This isn't possible, because MiNT only allows to read the memory
attached to a process through the /proc filesystem (this could be
called a feature :-})

|> More a sign of my ignorance than a failing in the program, I'm sure: I

AFAIK, this is not possible, too. Sorry. (Under Unix we have Emacs ...)

To compiler gem progs you need the gem.olb libs. When you compile anything
which uses the AES or VDI you must include then gem.olb using the -l switch.

eg. gcc foo.c -lgem.olb -o foo.prg

Hope that helps.

Michael

The original code is in ROM so it can't be overwritten. These sort of patches
hook into the system traps. There are vectors held in RAM that normally point
to the ROM OS functions. You can hijack these to point to your own routines
which can either duplicate the function or do something else and then continue
with the ROM routines.

Hello,

Does anyone know if it is possible to read information from a audio CD
with a CD-ROM player.

How should this be done?

I would like to read the tracks, index and there times for automatic
storing in my CD archiving programm.

Is there anybody out there which can help me?

Marcel.

TSRs can do whatever they like! Programs that replace/enhance system calls generally change a TRAP x vector (they're held in low RAM) to point to a new handler (somewhere in your TSR).

Patchlevel 43 of the MiNT library is now available on
atari.archive.umich.edu in atari/Mint/Lib.

mntlib43.zoo ...the library source
mntinc43.zoo ...the includes
mlib40d.zoo, mlib41d.zoo, mlib42d.zoo, mlib43d.zoo ...patches since
the last release

The compiled .olb library (mntolb43.zoo) will be available soon if
there are no major problems with this release.

As usual, mail about the mint library goes to
entropy@terminator.rs.itd.umich.edu. Mail sent to the address from
which this message was posted will be ignored. Or flamed. Or
something. Just don't do it. Really. Thanks.

Cheers,
entropy

909. Re: Problem with ICD Link

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-15 20:57:17 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLAA7I.CG8@watserv2.uwaterloo.ca>
Source record: 34241
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Thanks to everyone who replied on this. The problem is solved.
The LINK requires termination power, the Advantage+ doesn't.
BOTH require disabled parity (this was not my problem).
It seems that the 85meg drive was the only one supplying the TERM POWER
(although it had no jumper to select this). Both the 105 and 213 weren't
supplying it. I didn't have jumper specs for either drive, so I just
tried all the jumpers that I didn't know on the 213 (non SCSI-ID, parity,
or spin-up) until I found the one that worked. This solved the problem,
the Link works fine.

Thanks again to everyone for the suggestions,
Sam

I tried this option last night, and it worked perfectly. Of course, I still
don't think it's 100% correct, and it's not hard to imagine a bitplane layout
for which it fails (eg. old Apple]['s format).

It's 10 lines of code (why the hell didn't Atari implement it!).

Does anyone know of a graphics card which DOESN'T use the following
bitplane layout for monochrome:

```
Leftmost pixel
v
xxxx...xxxx <- Top line
MSB LSB
: :
xxxx...xxxx <- Bottom line
MSB LSB
```

?

Mupfel (part of the Gemini 1.x desktop replacement; it's also a separate
shell in that package) has a cat, but it's very (VERY!) slow for
concatenating files.

The venerable gulam has a cat (and a MicroEMACS built-in), but I don't
know anything about that, since I don't use it.

I thought the tfork() call didn't actually do anything... Am I wrong,
and MiNT has actual, working threads? If so, I've got some interesting
playing to do... I was thinking of a really groovey way of implementing
PBM-Plus using named pipes or sockets and threads...

If you're using GNU C, -mbaserel will make your code sharable... ex:

gcc -mbaserel -O -o hello.tos hello.c

will create a sharable hello.tos; multiple copies in memory at the same
time will use the same code and have separate data areas.

> i'd really like the programs to share memory. pexec mode 104 should do this

Hmm, sounds like you want to use shared memory then... ;-) Check the
shared memory docs in the MiNT distribution. (I'd give you an example,
but I haven't used it yet...)

gcc 2.5.x, x <= 7 can't build _68000_ binaries, thanks to a bug in the optimiser. The programs will work fine on a 68020 or up, since the problem is 680x0 (x >= 2) instructions stuck in the 68000 code!

> by the way, I'd like to make a cross-compiler on a Data General m88k machine..

> Atari port... even for a non-cross atari gcc!
> Heeeeelllp!

Grab "gcc258s.zoo" (or whatever) from atari.archive.umich.edu down in Gnustuff/Tos/Gcc... it has the diffs from bammi needed to build the cross-compiler.

You might also want to wait a week or so... I'm going to write a How-To document detailing my recent adventures installing a cross-compiler on an NCR System 3000 UNIX box (with a bunch of '486/50 CPUs, so it's pretty alien... builds ST binaries real nice though, and FAST).

It may only affect the Atari port then (and, I suppose any 68000-based
Suns, but I doubt they exist!). 2.5.x versions below 2.5.8 wouldn't
even compile hello.c for me with -O. 2.5.8 works fine.

2.4.5 worked fine... I think it's also the only 2.4.x that worked
properly on the ST... ;-)

> Anyway, I'm not going to use less VDI's for ANYONEs benefit.

Damn right! The VDI is there to make things easier for the
programmer; that's why the Atari can do a full-featured word processor
with scalable fonts, graphics, etc in ~2-3 megs while on a PC, where you
have to do literally everything "by hand" it takes 20-30 megs,
_even_under_Windows_, which _should_ do the same things as the VDI/AES
combo.

You can, GNU C++. But you'll need _at_least_ 4M of RAM (I don't think you can compile "hello.cc" with only 2M; it _might_ be possible in 2.5M).

A commercial product would be welcome, especially if it went a little easier on the memory. Dunno if it would sell enough copies to be viable though... there must be at least a dozen of us using GNU C++... :-\

Nope, it pops up the "illegal function call" alert box, just as it should; I've only seen it while playing with some neat MultiTOS-specific applications that didn't bother to check for a proper TOS version before trying to use their features (they were just little demo thingys hacked together in a little while).

Send it to atari.archive.umich.edu; you can log onto
msdos.archive.umich.edu and get into the archive (that usually works
better).

Many thanks to your friend!

The version on ftp.germany.eu.net:/pub/comp/atari-st/mint/gdb36p4b.zoo
works great; the sources are on there too... as a further test of my
cross-compiler, I rebuilt that gdb 3.6 and it works flawlessly.

Sometimes when I double click on a .PRG file the OS doesn't always run the program, sometimes it displays the 'Show', 'Print', 'Cancel' alert box. When I click on 'Show' it actually displays the file. I thought this executable file would be made up of binary numbers. Instead what I found was just normal ASCII characters and some extended characters.

Does anyone know why this is?

926. Got Falcon: What else do I need?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-16 13:22:18 UTC
From: djs@jet.uk
Message-ID: <1994Feb16.132218.18807@jet.uk>
Source record: 34259

I got my Falcon yesterday. It came with a few fairly useless things such as AFM, SAM and landmines. I am seeking opinions on what I will find essential (by which I mean things like TOS patches, rather than 'You need Cubase Audio and Gigabytes of disk').

It came with FPATCH2, I already have NVDI. I already know about, and intend to get, BACKWARD. Anything else I should look out for?

Anyone got a version of TapeBIOS that supports the Falcon SCSI port? (The version I have requires ACSI).

Finally, screen expanders: I will be using my SM125 for a while, getting SVGA later. Are there any versions of ScreenBlaster/BlowUp etc that will improve my SM125 display now, and improve my SVGA display later?

Thanks in advance for any help.

As far as I understand you, you are trying to do bitblits *into* a buffer in standard format. From memory, I would say that this is bound to fail. Even though, I cannot test it right now, I think I remember, that this will only work in "usual" graphics modes. It will not do in e.g. TrueColor on the F030 (both with and without NVDI) or on Matrix graphics cards (at least with the old driver software that came with my card). It does not make any difference, if the destination is just a single bitplane or multiple bit planes.

So long,

Markus

Hi,

>>|> Please try GDB 3.6 PL 4 from
>>/ftp.germany.eu.net:pub/comp/atari-st/mint/gdb36p4[sb].zoo

>I fetched it. It works. Unfortunately, under at least some circumstances,
>a bad program being debugged is able to bring down the whole system. Also,
>if there's a way to examine protected low memory locations I haven't found
>it.

I have a long-standing problem accessing global variables from gdb.
(including 3.6 patch level 4). It seems that gdb is just confused about
their addresses (it either accesses garbage or an illegal address, which
causes a crash). Has anyone else seen this problem? I sent email to A.
Schwab about it, but got no response.

Besides this problem I have found gdb 3.6 to be splendid and extremely
useful. When it takes 15-20 minutes just to link an executable
(Ghostscript), debugging with print statements is a major pain.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions:
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR] OR use the number address,
NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once. i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having to reply "y" for each
file
when asked "get {filename}?".
12) close [CR] to end (go back to ftp and
13) quit [CR] to go back to UNIX or.......
14 bye [CR] to end and go back to UNIX (or 'close' if you only want to quit the FTP site
you're
on for the moment)

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs
were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate uncompress program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...)
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an
other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer.
i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

From the LC5 docs I suspect it is [7][224] ie 7 tables of 224.
void vqt_get_table(int handle, short **map);

As an aside, HiSoft call it vqt_get_table in v5.60 whereas it was called
vqt_get_tables in v5.5!

From: mlehmann@austin.ibm.com
Message-ID: <CLC1q5.2x3K@austin.ibm.com>
Source record: 34265

I would like to know if a MiNT summary exists.

I want to know how to get it running on any Atari 680x0 machine.

I have a SST030 which I can't get the MiNT Distribution Kit to work on.
I can't get to the point where I want to compile the newer 030 enabled
MiNT kernal. MiNT version 0.95 and 0.99 just crash before I can get the
desktop or any other program working.

I don't mind paying for MiNT, but I want a working version for the 68030.
I have a MegaST 2 with the SST030 running TOS 2.06. Can anyone offer me
a solution. Could someone compile a version, and let me borrow, not copy
their version so that I can compile my own version and IMMEDIATELY destroy
the borrowed MiNT. Or can I buy it somewhere?

Thanks

You're probably right, that seems the most sensible arrangement. But
how then do you actually use the returned array?

It's enough of a clone that the PD demo version can compile the Turbo Pascal 6.0 demo files (non-windows stuff) without modification (including all the OOP stuff). I tryed it on the IBM source files - no trouble.

Interesting note: the BGI vector fonts that ship with Kandinsky can be used with the Pure Pascal demo ....

Hello,
does anyone know for sure wether 44Mb syquest disks (removable
hard diks cartridges) that are formatted in PC (MSDOS) are readable in
atari ST or TT nad if so wich AHDI have you used ?

You can order the "M68000 Family Programmer's Reference Manual" from
Motorola. It contains information about MC68000..MC68040, CPU32, MC68851,
and MC68881/MC68882. Don't know about the price.

942. Questions!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-17 14:45:00 UTC
From: michal.kowalski@troed.ct.se
Message-ID: <2d638308@troed.ct.se>
Source record: 34275

Some questions of new AES, MiNT releases and Atari system's programs.

WINDOWS.
I know that with new AES version (4.00 and greater) there is posibility to use some new window feature. I mean there is extended set of constans WF_xxxx to create a window. It is possible to declare the window that even inactive is always on the top ? Please send me info of wind_get() and wind_set() functions using this constans.
Is it endless possible to find out about current settings of colours of window's elements (sliders, title, etc.) ?

SUBMENUS.
In Falcon desktop I saw submenus (for example to change video resolution). I look for description of functions to use them.

DIALOGS.
In multitasking system dialogs should be done via real window without using wind_update(). Is there a function(s) in new AES to replace form_do() ?

OBJECTS.
Falcon uses color icons. I think these are new GEM objects. Could you told me about new objects implemented in AES and their specifications?

RASTER OPERATIONS.
Is there a function(s) in VDI to copy color raster (for example with 4 bitplanes) to the screen, which currently uses 256 colours (8 bitplanes). I use vr_trnfm() and then vrt_cpyfm() to copy monochrome raster to colour screen. But I am not sure if I have to write my own functions to solve problem with colour rasters described above.
Both VDI functions to copy rasters use structure called MFDB which allows to specify different numbers of color bit planes. Does it work in (true)color systems how I expect ? (the problem is how to convert raster with 16 colours to another with biger number of colours; of course after conversion colours should remain the same).

ATARI HD DRIVER.
With Falcon is supplied AHDI version 6.06. What's new in this version in comparison to AHDI ver 3.0 ? Is there something new in the structure pointed by system variable pun_ptr ($516) ?

EVENTS.
I use function evnt_multi to wait for mouse buttons event. The problem is to ask about pressing left OR right mouse button. I know that to do so I should set second evnt_multi() parameter to $102 but it's not officially documented. Does it work correctly under new AES ?

Next important question: may I use several calling of appl_write() ?
I would like to inform my process of some different events, so it should be nice to execute appl_write(). I don't know if internal buffer is big enough to store some messages (of course beetwen appl_write calling there is no evnt_mesag()).

MULTITASKING.
I would like to find out if there is a way to set an application working exclusive (I mean no one else can work simultanously) ? Is it possible by changing the program's header ? What is the meaning of long word called ph_prgflags (offset $16) in program header while working under MiNT ?
In TOS version on ATARI TT there are functions to lock files (in GEMDOS). Can I lock whole partition ? (problem for disk editors, etc.)

MEMORY.
In old TOS versions there are problems with memory allocations. Is there still limitations in amount of calling GEMDOS function Malloc() in new TOS versions ?

FILE SYSTEMS.
Will Atari implement new file system in future versions of TOS ?
How does it looks under MiNT (I mean installing new file system) ?

MC68060.
I know nothing about
Can I lock whole partition ? (problem for disk editors, etc.)

MEMORY.
In old TOS versions there are problems with memory allocations. Is there still limitations in amount of calling GEMDOS function Malloc() in new TOS versions ?

FILE SYSTEMS.
Will Atari implement new file system in future versions of TOS ?
How does it looks under MiNT (I mean installing new file system) ?

MC68060.
I know only some facts about MOTOROLA 68060. But where is MC68050 ?

Sorry, but my English isn't good enough. I hope you understand me and all I can do is politely ask you to replay my questions.
Thanks.

Most of my disks (PC-formatted, via FDFormat) are 82x21x2, which
if my math is right (probably not) is about 1.72megs each (and
except for having to change the disks' serial numbers - which
is the pain when formatting on the PC) the disks have worked fine for
me. I just wish I could find a formatter on the ST to allow 21sectors...

948. Re: HELP! Pascal problems! ***

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-17 21:49:45 UTC
From: martini@heaven7.in-berlin.de
Message-ID: <EL4LBO9H@heaven7.in-berlin.de>
Source record: 34281

```
In <2ji2re$d07@canopus.cc.umanitoba.ca>, you write:
:
: So, you say, why not just write the whole array with one write(my_array)
: statement on a "file of my_array_type"? Well, that worked when I had an
: array length of 1000...and it was very quick. BUT, now that I need 2000
: records, it WON'T work. The reason (I figure) is because 2000 records *
: 56 bytes each = 112000 bytes (previously I was using 1000*56=56000 bytes).
: Read and write seem (undocumentedly) to only be able to handle up to 65500
: (whatever MaxWord is) bytes! Anything above MaxWord and the file is
: happily written, except it turns out truncated!

I tried to reproduce your problem with Pure Pascal 1.1, but I couldn't.
It just works ...

: So, I figure, why not save one half with one write statement and the other
: half with another? Here's how I tried it:
:
: size:=SizeOf(RcComp)*1000; # Get the byte size of a half
: Rewrite (fcomp,datapath);
: BlockWrite(fcomp,Addr(comp[1]),size,r1); # write half #1
: BlockWrite(fcomp,Addr(comp[1001]),size,r2); # write half #2
: Close (fcomp);

This cannot possibly work, since you got the type of the second
BlockWrite parameter wrong (maybe you DID do a bit of C programming
lately, eh? :-) ). BlockWrite expects an unnamed var parameter
(like Addr (!)), something it can take the address of (you don't
need to do that!).

Here is a litte program I wrote in Pure Pascal to reproduce your
problem. It writes to identical files to disk.

---------------------------- MUNCH -------------------------------------
type
DummyR = record
Data: array[1..56]of Byte;
end;
DummyA = array[1..2000] of DummyR;
DummyF = file of DummyA;

var
I: Integer;
DA: DummyA;
DF: DummyF;
F: file;
```

```
begin
for I:=1 to 2000 do begin
FillChar(DA[i], 54, 32+Byte(I mod 64));
DA[i].Data[55]:=$0D;
DA[i].Data[56]:=$0A;
end;

Assign(DF, 'DUMMY.FL1');
Rewrite(DF);
Write(DF, DA);
Close(DF);

Assign(F, 'DUMMY.FL2');
Rewrite(F, Sizeof(DummyR));
BlockWrite(F, DA, 1000);
BlockWrite(F, DA[1001], 1000);
Close(F);
end.
---------------------------- MUNCH -------------------------------------

Hope this helps, especially the second part. (You could as easily
write BlockWrite(F, DA[1], 1000) if you like that better.)

From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1635@usdtsg.DaytonOH.NCR.COM>
Source record: 34284

I've just purchased an AlberTT graphics card for my MegaSTe, but alas,
I've found that it doesn't quite work with my monitor. The card requires
a monitor that supports 48khz horizontal sync - my ACER 7015 on the other hand
supports 15~36 khz horizontal, hence my problem.

Does anyone know of a way around this? Is there a way to change
the frequency to something lower? If not, what kind of monitors
do actually support this rate? standard VGAs? One thing I've learned
tonight (and should've know better) is that most folks working at
computer stores have no idea what they're doing. I figure someone
out here on the net might be more knowledgable...

Thanks in advance...

Rob

While we're on the subject of what the AES _should_ do: return an error code
(so that a program can check for unsupported AES features and take appropriate
evasive action), instead of popping up that silly alert box... Sigh.

> Does anyone know why this is?

Actually, ALL computer files, including text and program files, are made
up of binary numbers. The SHOW/PRINT/CANCEL function simply "Shows" those
binary numbers as their ASCII equivilant. Because a text file is written
in ASCII it "Shows" like it should. The program, however, is not written
in ASCII and when the OS tries to "Show" it, all you get is the ASCII
equivilant to a bunch of binary numbers which have no connection to the
ASCII code.

In a previous article, Trevor Cordes relates:
(He wants to be able to save/load an entire array (not 1 at a time).)

> Well, that worked when I had an
> array length of 1000...and it was very quick. BUT, now that I need 2000
> records, it WON'T work. The reason (I figure) is because 2000 records *
> 56 bytes each = 112000 bytes (previously I was using 1000*56=56000 bytes).

Your analysis is correct.

> Read and write seem (undocumentedly) to only be able to handle up to
> 65500 (whatever MaxWord is) bytes! Anything above MaxWord and the
> file is happily written, except it turns out truncated!

Actually, if you look at the Help info for the System2 unit, you will
see HighSpeed's definition of the FileRec data type:

```
{HighSpeed Pascal-1.5/1.6}
FileRec = Record
fInpFlag : Boolean;
fOutFlag : Boolean;
fHandle : Integer;
fBufSize : Integer; {<<<} {Record size (treated as Word)}
fPrivate : Array[1..6] of Integer;
fUser : Longint; {Unused, free to use}
fName : Array[1..64] of Char; {File name (ASCIIZ format)}
end;
```

Note that even though the record size is defined as an integer, it is
really treated internally as a Word (i.e., unsigned). Also, the file
isn't simply truncated at 65,536 bytes... what you get is the true size
modulo 64k, in your case 46,464 bytes.

I confirmed this limitation in both version 1.5 and 1.6 of HighSpeed.
It didn't arise in v1.1, because such large structures were not possible.

> Ditto with BlockWrite. It's parameters can only be integers.

This is correct. Originally, LongInts were allowed (back in v1.1), but
they changed it to be more "compatible" with Turbo Pascal. IMO, this was
a mistake.

The large writes work fine in Pure Pascal, due to the following record
definitions for the FileRec type, which is very close to true Turbo:

```
{Pure Pascal (almost Turbo)} {deviation}
FileRec = record
Handle : Word;
```

```
Mode : Word;
RecSize : LongInt; {Word in TP5 (extended!)}
Private : array[1..25] of Byte; {1..26 in TP5}
UserData : array[1..16] of Byte;
Name : array[1..119] of Char; {0..79 in TP5}
Reserved : Word; {not in TP5}
end;
```

Note one final deviation in the implementation of HighSpeed is that the fName field occupies 64 _words_, not 64 bytes as you would expect. Unlike Turbo, HighSpeed doesn't automatically pack byte arrays unless you specify "packed" explicitly. You can easily get burned on this if you try to map equivalent structures.

> The compiler informs me blockwrite can't handle the "Addr(comp[1])"
> part as I guess it doesn't like pointers (why?)!

This is because the parameter to the Block I/O routines must be a buffer variable, not the Addr of one. Lookup BlockWrite in the online Help:

```
def: Procedure BlockWrite (var F:File; var Buf; ...);
```

All you need to do is just drop the Addr() off. It will work fine then. Your solution to break the output into 2 BlockWrites is probably the best choice. That way, you preserve Turbo compatibility (if you want it). The other option would be to write your own binding function to the GemDos Fwrite routine, which has no problem writing megabytes with a single call.

I hope this was of some help.

- Mark

P.S. I'll pass your problem report on to the people at HiSoft and D-House via GEnie. At the very least, the compiler should tell you that it can't write structures of that size, not silently truncate your output.

Martin Ibert's informative reply reminds me that I should also alert you to another HighSpeed deviation (documented) from Turbo Pascal in its BlockRead/Write routines, the size parameter is a _byte_ count, not a record count as it is in Turbo (and Pure) Pascal.

While there are some cases in which this variation can be useful, I think it was rather silly of them to reduce the Block I/O capability in the name of compatibility, then destroy compatibility in the same routines by deviating from the parameter semantics.

IMO, they would have been better served by providing true Turbo compatibility for the Block routines (possibly extended, as in Pure Pascal), and providing arbitrary byte count I/O via a separate binding routine to the GemDos Fwrite.

- Mark

tfork works just fine... I guess you could consider them threads, although
they really are full-blown processes. They get their own basepage, but just
execute in the same code and data space as their parent. You definitely need
to be careful about library routines like malloc, though...

Well, one thing more that you'll need is a video signal! I.e., when you
combine HSync and VSync you'll get a composite _sync_, but that's only
part of what you'll need for composite _video_.

You'll need a circuit, incorporating a Motorola MC1889(?) or compatible
IC to combine the R-G-B signals and convert them to basebase video, with
the required sync.

The Falcon's parallel port is a little closer to the PC standard than the ST's,
maybe one of those Xircom parallel-port ethernet boxes would work. I've been
thinking about getting one to try myself. (It has acknowledge and select...)

This was the old Mupfel. Mupfel 1.99 (from gmni2.tos) doesn't have a cat at all, but you can use the cat.ttp from mupftl02.tos (a command line tool collection).

If you don't use MTOS' AES, you'll have to turn off memory protection (rename
mint.prg to mintnp.prg).

The below was posted to the MiNT list on 25th November last year. I
don't know if it was ever realised. If you want the name of the
author, I could forward the entire message.

:Some time ago, a friend and I started work on an ethernet interface
:unit for the ST, as much as a learning experience as anything else.
:Since then, it's come along slowly, and developed into a somewhat
:more diverse device, however it's roots as a SCSI/ACSI <--> ethernet
:adapter remain.(cause the first)
:
:For a while now I've been working on a neat and portable way of
:adding a set of Berkley-compatible socket calls to MiNT - possibly
:drawing heavily on the net-2 code (it is a little elaborate in some
:places, but I can certainly vouch for its effectiveness).
:
:The obvious way to do this is via the loadable filesystem interface,
:unfortunately there is no pleasant way to map the rather large number
:of calls that actually need to be handled by the kernel onto that
:semantic.(Especially as the kernel likes to preprocess quite a few
:of them before the filesystem finds out)

>applications that didn't bother to check for a proper TOS version before
>trying to use their features (they were just little demo thingys hacked
>together in a little while).
I can't remember what started this thread (and the article has expired here by now), but:

When I got my Falcon, I tested out some of my own programs. Those that I wrote some time ago worked fine. Those that I wrote recently, and had tested under TOS 1.6 and MultiTOS, failed with the "Illegal AES call" alert. Investigation revealed the culprit to be the appl_getinfo calls that I used to determine the AES funcationality. Although the Atari Compendium documents this call as being available from AES 3.4, running it on that AES (in TOS 4.04) failed. The HiSoft MASS book says that the function became available in AES 4.0 (as in MultiTOS); this seems to be borne out by experimentation.

This is off the top of my head so I'll have to check for certain......

find the line #E in you newdesk.inf file and change the 11th number to a 6.

eg #E 00 55 63 83 34 34 82 64
^
this is the 11th, change it to a 6.

if it doesn't work let me know and I'll look it up.
The 11th number and a '6' is definately right, it's just the line
I'm not sure about right now.

It does work, I've got it on my Falcon. You have to boot with this though,
not just using 'read inf file'. And don't save your desktop, it overwrites
this modification.

Nice one,
Phil.

965. Falcon resolution problem.

Newsgroup: comp.sys.atari.st.tech

I seem to have come across a little bug in the Falcon.

I've got TOS4.04 blah blah blah....and when using a TV

if you do a Getrez, there's no way it will return '3' (a Falcon res).
I seems to ignore the amount of colours and use the res as an ST mode.

Eg 256 colours, 640x400 returns 2 ! ST high res.

Is this a bug, or is it correct and 3 is when you are using a VGA monitor ?

God Damn you Atari,

Phil.

Montype() will return a 3 for TV.
VsetMode with -1 will return the current mode details. The Falcon has very flexible modes so I would expect getrez only returns meaningful numbers if using ST modes. You should really use the VDI to enquire about the current screen.

> Of course I could be completely misunderstanding you.
>
> Dan Ackerman
> ackerman.29@osu.edu

I assume, you use vro_cpyfm to copy a hicolor bit block onto another hicolor bitblock. This is perfectly fine. You can also use vrt_cpyfm to copy a single plane bitblock onto a hicolor bitblock. In any case, you will have to convert the bitblocks to device-dependant format before copying them.

If I understand what Warwick said, he was trying to copy a single plane bitblock onto another single plane bitblock (possibly even without prior transformation to device-dependant format). This will work only if side-effects in the VDI routines support single plane bitblocks as a destination. As a general rule this is true if you do not use graphics cards and run your program in one of the standard ST or TT resolutions. Thus, your program should not require this feature (? bug?) to exist. Nevertheless, if you need this behavior for optional code, you could ask the user, if the display looks fine and then use this "shortcut" for doing what you want; on the other hand, if the user reports that the display looks somehow distorted, use your own routines for doing the bitblit operation.

Happy hacking,

Markus

Getrez() shouldn't not be used at all. The VDI has to be used to get
information about the current resolution.

I guess the question was _not_ about the _meaning_ of the ASCII-codes.
I also wondered about this: Why does TOS sometimes SHOWS *.PRG-files
instead of RUNNING them ??? I never had this problem with Mag!X.

971. Falcon SCSI Drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-19 00:52:41 UTC
From: jeff@leda.Arizona.EDU
Message-ID: <2k3nsp$28v@auggie.CCIT.Arizona.EDU>
Source record: 34404

Hi gang! I'm deperate to get a large SCSI II drive for my Falcon. The
catch is that drives that I can buy from Atari dealers who guarantee Falcon
combatibility are, at the absolute best, $1.31/Meg, and you only get a few
choices in size.

What I need to find out is how hard it is to get a mainstream SCSI
drive to work with a Falcon. I've heard the biggest problem is with D2D.
(Sampling to/playback from the drive) Supposedly, the drive needs very specific
timing for this to work, and few drives match up. I've also heard some horror
stories about Atari/ICD drivers not working the best.

If anyone out there has succeeded in connecting an inductry standard
drive to their Falcon, could you let me know about it? Especially the D2D info.

Thanks a lot!
jeff

972. Lattice on a Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-19 01:02:15 UTC
From: jeff@jupiter.ame.Arizona.EDU
Message-ID: <2k3oen$28v@auggie.CCIT.Arizona.EDU>
Source record: 34405

Hello again!

I am FINALLY making the transition from GFA 3.6 to Lattice C 5.6 on a Falcon, and I am finding the process excruciating. The VDI calls are somewhat cludgey and slow. I can find no good examples of doing things like sampling sound or even copying memory blocks to and from the disk. I'm at the point where I don't expect any command to work 100%.... if I get things that work a little, I'm thrilled.

So, I was wondering... anyone out there using Lattice on a Falcon must have developed their own libraries to do some basic things. I would be very grateful for any examples/sample routines that do the Falcon basics. (E.g., I'd like to figure out how to use the outline fonts, but right now I can't even get the old raster text effects to work.) I have all the Atari OS calls all right, but there seems to be a whole lot more to this stuff then to just execute a command and expect it to work.

(BTW, I'm not against non-Lattice C, non_Falcon advice... its just that I feel there'd be a real low probability I'd get any library calls to work, as even the Falcon Examples from Lattice just bomb out on my Falcon.)

Thanks for helping me get on my feet! :)
Jeff

No! Just having the two syncs will give you a lovely, perfectly synched, black screen! You need to have some kind of video signal... Motorola has a chip that works for this purpose, just wonderfully... It's (I think) MC1377.. Used in many things.. (Also - if you know someone with an Amiga, with their RGB -> composite converter, it works as well.. Just have to mangle a connector on to it...)

974. Connecting an Atari ST -> to a Linux Box

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-19 06:07:56 UTC
From: rdo@kynes.bison.mb.ca
Message-ID: <1994Feb19.060756.3819@kynes.bison.mb.ca>
Source record: 34407

I've got a null-modem cable connecting my Atari 1040STE to a 486 running
Linux. This is nice, but it's a 'dumb' connection. I'd like to get a
more intelligent connection between the two so I could:

- share hard drives (e.g. NFS)
- share a printer between both machines

Now, this kind of stuff can be done using TCP/IP and probably other software
exists to do this. I haven't posted this to the Linux groups since I need
the same software on both machines. Hence, it's going to depend on what's
out there for the Atari.

I have MiNT, but don't actively run it (just waiting for a good enough reason).
I probably will get Geneva in a few months. I have 4meg RAM.

Any ideas to suggest?

Russell Ochocki rdo@kynes.bison.mb.ca

975. Falcon with SCSI-2 HD prob.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-19 15:03:58 UTC
From: kosmatoo@JSP.UMontreal.CA
Message-ID: <CLH8Io.2Iv@cc.umontreal.ca>
Source record: 34408

posted for brunos@mafalda.math.mcgill.ca

I just bought a new SCSI-2 drive for my Falcon, plugged it in
with a huge SCSI-2 cable, etc. This half gig drive is configured to
SCSI I.D. 7. At present it is impossible for me to change it's ID to 0.

My Falcon won't recognize it: It boots up and says "Couldn't find device 0".

When I try and run any of the Hard Disk Utilities (HDX, HDutils, etc) they
just print to the screen something really fast and exit. We don't have a CLI.

The Big Question:

How do I get ANY of this software included with my Falcon to recognize a
hard disk with ID 7?

We've tried everything. The manual says nothing. Comp.sys.atari.st.tech
must say something?

Thanks, friends. Email to brunos@mafalda.math.mcgill.ca

Ah, you simply forgot to include the GEM/VDI library... Add -lgem to
your command-line, and it should work (assuming you've added the GEM
libs from atari.archive.umich.edu to your setup).

TOS doesn't show anything at all. It is the desktop that decides whether a
double-clicked-file should be run as a program, displayed as a text, or
some other action. I never had problems with the default Atari desktop.
What TOS ersion are you using?

You use the AHDI driver wich came with your Falcon, Right??

AHDI Only recognice SCSI devices if the first is set to ID 0, the second to ID 1
anb so on, (STUPID!!!) So you must change the ID on your drive... OR You can
get ICD's software, were you can set the boot partiton/device to whatever you
wish!!...

Or you can try to Patch the AHDI driver, I read about a PRG wich would do this,
BUT I havn't sean or tested it... I don't even know the name of it... But you can propably
find it at: atari.archive.umich.edu

>When I try and run any of the Hard Disk Utilities (HDX, HDutils, etc) they
>just print to the screen something really fast and exit. We don't have a CLI.
>
Sure they write something... They can't find any devices... AHDI couldn't find
any so TOS don't think you have any!!!

We have CLI's, Just start MiNT and use tcsh or whatever...
(But find some HDutils wich uses CLI is another thing...)

>The Big Question:
>
(The answer is 42!!)

>How do I get ANY of this software included with my Falcon to recognize a
>hard disk with ID 7?
>
You don't.... Try changing the ID!!! (You must be able to do that!!!)

I'm not sure what the capabilities are, but there does exist a SLIP for the
ST, and some TCP/IP stuff. Check out ftp.uni-kl.de and ftp.tu-clausthal.de.
This might give you a start.

I also have experienced this from the Atari desktop.
Running on a 1040STe with TOS 1.6 and 4meg.

This is because bytes is bytes is bytes. A text file is just a collection of bytes restricted (well not really RESTRICTED, but by convention) to the alpha numeric characters and some simple control characters. A program is machine code or binary, but the ST has a character in its set for all 256 possible combinations of a byte, so viewing the machine code can't help but come up with characters, most of which will be recognizable. Programs contain all sorts of text too, for prompts and file creation etc, so somewhere in the midst of most .PRG/.TOS/.TTP/.GTP files, you'll find all sorts of messages and such.

The problem may well be with the Atari hard drive booter software,
since it wants to see the hard drive device numbers starting at
the lowest number, and incrementing in order. Try getting ICD's
SCSI Pro Utilities, that should do it for you. (Note: if you don't
have an INTERNAL hard drive on the Falcon, you're gonna hafta have
ICD's booter v6.4.3 or higher...)

Just to follow up on this item once more: Peter Hiscocks sent me the file and I have uploaded it to a.a. (it seems not to have become available yet) and to ftp.uni-kl.de (where it _is_ available in pub/atari/incoming). Unfortunately the file, named txdrwdoc.zip, does not include the translator's name; Peter Hiscocks has since informed me that the translator is Robert Tarjan. Thanks very much to Robert for a fine translation.

>
> - share hard drives (e.g. NFS)

I was just wondering if something like this would be possible
with a netbsd pc. Doing NFS over a 19200 baud serial line sounds
painful though. It seems like it would be better if the thing could
be made to work over a parrellel port (then get a second parrellel
port for the pc, and attach the printer there). As I understand it (a
gross overstatement) you would first have to write a centronics
datagram driver for both systems, then get linux nfs to use it, then
port nfs to mint. I don't think you could get nfs or anything else
linux would understand working under plain tos. But then I really
don't know. If and when I get a dirt cheap 386, this is exactly what
I will try, so I would aprecciate any feedback, or perhaps, any
explanations of how deeply confused I really am.

Jason

ICD's pro driver software is definitely worth buying. (an opinion).
BUT, I am almost sure that you don't need to do this. I do not own a Falc
so I have go by what I hear, but I think I have heard that you just need a
text file which tells AHDI which SCSI devices to check, and this you can
have the drive set to any ID you wish. Surely these programs came with
instructions???

Hi folks,

since saturday I'm the (happy?) owner of a MegTT, which is a fastram card.
Currently it has got 8MB RAM and it works really nice (TeX is almost twice as
fast).
Now my problem: Since I plugged in this card, my NOVA VME plus doesn't work
anymore. Sometimes it displays nothing at all,sometimes only the menu and the
best it did was 640*480*2.

So, is it a hardware problem?
Doesn't the driver (Version 2.01) support TT-Ram?
Is the TT powersupply (64 W) to weak for 13 Mb (4ST+8TT+1Nova) ?

I'm dispaired, please help me!

Thanks in advance,
Thomas.

It's just a very slight bug in the Desktop, it doesn't happen very often.
I have TOS 1.4 and it has happened to me a few times. All you need to do
is double click on the file again and it will work. Also sometimes a *.PRG
file will appear looking like a normal file (the icon) rather than an
executable, just renew the directory. Goodness knows why it happens (anyway
I use Mupfel all the time now so I don't see the bug!!)

Andy.

I had a simalar problem recently. The following file was posted
on GEnie and tells how the problem can be fixed. Hope this helps!
By the way, I didn't write this file. The credit line is at
the bottom.

Walt Lamar

If you have an ATARI SM124 Mono monitor that has recently
gone belly up, read on. In particular, this pertains to those of
you who have tweaked the coils and trim pots in your monitor to
get a full raster display, although it's quite possible that
unmodified monitors have been affected as well. Also, if do have
a modified monitor that's behaving fine, you still may want to
consider the suggestions described in this article, as it could
save you a surprise monitor failure that (you _KNOW_) will
definitely happen at the worst possible time.

Finally, this text describes a problem particular to the
monitor manufactured by "Gold Star Co", which has the Brightness,
Contrast, and Off/On Volume controls recessed on the right side-
panel. There may have been other manufacturers of SM-124's with
completely different electronics, so if ANY of the physical
component layout descriptions written here do not seem to jive,
then all bets are off and the information given here may or may
not have any practical value. In addition, the monitor 'fix' I'm
going to describe should only be done by a trained electronic
technician, or at the very least a knowledgable electronics hacker
with good soldering AND de-soldering skills!

Disclaimer: You can easily get knocked squarely on your butt by the voltages present in your monitor. Weather or not it kills you probably depends on just what you fall on, your present health, and where the resulting flying monitor lands. In any case, your decision to implement the changes described herein is completely your own. I disclaim all responsibility for your health, safety, or any damage to equipment or property caused by fires, implosions or explosions, earthquakes, global flooding, or galactic imbalance resulting from your use of any information in this writing. I think that about covers it ;)

So... once upon a time, we all got our nifty HI-RES mono monitors, powered them up, and the very first thing we all said was, "Ah.. MAN!!... This monitor is screwed up". Perhaps stronger language was used, but the fact was that we all thought something had to be wrong. Alas though, the tiny picture on that screen was exactly what the ATARI mystics had intended! Of course, it wasn't long before many daring hackers boldly removed the monitor's covers, cast their warrantees aside, and discovered a way to expand the tiny picture to full size. The information spread quickly through the worldwide internets, spider-nets, and fish nets, and soon all mere mortals had full screen displays and could actually read that 6 X 6 font! And so, the all lived happily ever after. But then one day years later, a curse fell upon the land, and darkness fell upon the faces of many of these monitors.

Ok, enough with the story narrative. By now, you're beginning to get the picture (no pun intended). The modification to fill the screen does indeed place an additional stress on a portion of the monitors circuitry, which coupled with a design error quite common to many types of computer monitors, ultimately caused the failure. The good news is that I've now seen quite a few monitors with this identical failure which is 100% repairable, and should leave you with 'good as new' results. The bad news is that you do need some technical skills, but even if you don't, finding a techie friend to help will be abundantly easier having a possible procedure for repair.

page 1

Brief technical summary. Right near the coil you adjusted to spread the horizontal width of your display, there's a 2.2 uF capacitor. More specifically, it is a non-polarized electrolytic capacitor, which is actually 2 polarized capacitors wired 'back to back' in a single enclosure. As the screen is widened, the peak voltage level across this part increases, thereby causing more internal stress. This situation is further aggravated by the type of part as well. All capacitor types have certain advantages and disadvantages and when it comes to electrolytic types, the advantage is smaller size. It's disadvantage however is that at higher frequencies, it has high 'leakage' current and acts more

like a resistor. The Horizontal frequency passing through this capacitor is in fact quite high, and the resistive qualities at these frequencies cause the capacitors to generate significant heat. Over time, that heat will cause the part to fail even in un-modified monitors, but the modification certainly speeds up the process.

If your monitor has fallen victim to this failure, in a way your lucky. There's a fair chance that the problem (as said earlier) would happen one way or another anyway, and at least now you have a possible fix. First, you need to disconnect the monitor and open it up. If you have the chassis I'm describing there will be two screws on the upper sides, visable from the back; two more screws on the bottom; and a single screw on the back above the power plug, which is a removable 'spade' type AC connector. After removing the screws, you can remove the back cover, but be sure to be careful of the speaker connections. The speaker is mounted to the inside of the cover, and connects to the monitor's main PC board via a small removable plug. It's a bit tough to get to, but trust me, it IS removable.

Once the cover is free, there are 2 fuses to check first. From now on, all references to right and left will assume you are behind the monitor, with the screen pointing away from you. There is a small PC board mounted vertically on the right side of the chassis which contains a 0.75 amp fuse. There's also a 2 amp fuse immediately to the right of the speaker plug you removed on the main board. Check both fuses with a DVM or other suitable instrument. Most likely, you'll find that it's the 2 amp on that is gone, but either one blown is possible. You can buy these tiny fuses at Radio Shack, and while your there, you can pick up a much more modern replacement for the capacitor we mentioned earlier. There's also a resistor that often cooks when this failure occurs, so you might as well get all this stuff at once. If the problem turns out to be something else, at least you'll be prepared for the eventuality. In any case, read on to do a 'walk through' before buying, to make absolutely sure your chassis physically matches the one we're discussing.

At your local Radio Shack, pick up the following items:

fuse (pkg of 4) 3/4 amp 270-1048
fuse (pkg of 4) 2.0 amp 270-1052
fuse (pkg of 4) 5.0 amp* 270-1056
capacitor buy 2! 1 uF, 200v metal 272-1055
resistor (pkg of 2) 680 ohm, 1/2 watt 271-021

* optional purchase, see text.

Since we have plenty of extra fuses now, start by just changing them, and setting up the monitor (still uncovered) with your ST. If the display comes up normally, leave everything powered up and wait a few hours. If all goes well, you can either make the fix were going to describe anyway to save future grief, or put the other parts away, along with this text, in case the problem returns.

Assuming the problem did not go away (no display and/or fuse blown again), there are two paths you can take from here. You _can_ just go ahead and change the suspected components without really knowing if they are at fault, since they'll probably need replacement eventually anyhow. The other possibility is that you don't want to to this until you're a bit more sure it's necessary. If that's the case, read the next few paragraphs. Otherwise, just skip over to "Making the Repair".

If you do want to do some checking, here is a possible (but not foolproof) procedure to see if the suspected capacitor is indeed the culprit. If the 0.75 amp fuse on the vertical board was blown, temporarily replace it with a 2 amp. If the 2 amp fuse on the main board has blown, temporarily replace it with one of the 5 amp fuses. Set up the monitor, still open, near your ATARI, and connect the monitor cable to your machine. Boot the ATARI with the monitor still off. We want to keep our 'powered up' time with the larger (wrong) fuses to a minimum. Now, hook up the power cord and turn on the monitor, being ready to instantly kill power at the first sign of any unsafe condition such as smoke or electrical arcing.

With the higher current fuses installed, the display will probably still be out, but the green pilot light on the front panel _should_ light. If it doesn't, then either the new fuses have blown, or a problem exists somewhere else in the circuit. Of course, the pilot light could just be shot, but if the higher current fuses do actually blow, then forget about the remainder of this discussion and just try implementing the suggested repair. Also, if the screen display _does_ appear with the larger fuses, don't be to happy yet! Twice now I've seen the 'crippled' capacitor seem to work fine for awhile before the final breakdown. So weather the screen display comes up or not, proceed to the next step as long as the fuses are not blowing.

page 3

Locate Capacitor C714. It will be the round cylinder on the left side of the main board (from the back), in-between the coil you adjusted when you increased the width and the flyback transformer. The coil is the only adjustable coil on the board, so you can't miss it, and hopefully you know that the flyback transformer is the thing-y with the wire that goes into the top of the picture tube! Locate the capacitor... but don't touch it yet! The flyback puts out thousands of volts, and if there is a flaw in

it's insulation, it could arc right into you hand. Just leave the unit powered up for a few minutes, and then turn it off. Now, with your finger, move close to, and finally touch the capacitor from the top. What you're looking for is a _HOT_ part, so be careful! If in fact the part is really hot, it probably has shorted and needs to be replaced.

Also, immediately to the right of the coil, also on the main board is a diode (D-709) and a resistor (R-221). Take a good look at the resistor to see if it looks stressed or burnt. If you want, you can do an in-circuit check with a DVM to see if it has opened. You can make this measurement from the bottom of the board if you want since it's pretty cramped on top. Even if it has not died, you should consider replacement if it appears stressed, or the underside of the board appears burned and discolored at the location of the resistor.

Making the Repair

Making the repair is simply a matter of changing the parts, BUT... there's some special considerations here. You may or may not be aware that radio shack does have 2.2uF, 50 volt non-polarized electrolytic capacitor in stock! But using that part would be dumb since the conditions that caused it to die in the first place have not changed AND, the part was a poor design choice to begin with! We're going to use the two 1.0 uF metalized film capacitors which are NOT electrolytic, AND have a working voltage 4 times that of the original part! We will have to parallel both capacitors to get 2.0uF, which is reasonably close to 2.2 and in fact works just fine. First though, you'll have to de-solder the existing C-714, which will probably be a bit of a chore. Do that, and also get rid of the existing R-221 if it shows the signs of heat stress (or is open) as we discussed earlier. You can just cut it out if you want, since we'll be soldering the new parts to the underside of the board.

Now, take the two 1.0uF capacitors, and solder them together in a neat parallel arrangement, that has a pair of leads bent to accommodate the spacing of the leads on the original capacitor. Look at the underside of the board and observe the original C-714 solder pads, as well as the clearance to the bottom when the cover is replaced. Give it a little thought and come up with a mechanically sound and visually sensible combination. The capacitors again, are not polarized so direction does not matter. And remember... parallel, NOT series!!! Solder the parallel combination to the C-714 pads under the board. Try to push the leads right into the holes left by the removal of the old capacitor.

R-221 should also be replaced from the bottom side of the board unless you're really patient, and have some small tools. It's much easier to just trim the leads and tack solder it in place under the board. If the board looks a bit burned in this area, you may want to clean it up a bit prior to installing the new resistor.

Finally, don't forget to put the proper fuse values back into BOTH locations. The original fuse values are important protection and do not normally blow unless there is a real problem. I definitely do not recommend leaving the larger fuses values in place. Do a bench check on the ST again, still with the cover off. You may need to re-adjust the horizontal width, or the position tabs on the neck of the picture tube to center and set up the display. Once this is done, you can put the cover back on, and you're back in business. If the fix does NOT help, just double check your soldering and connections to make sure you didn't wire something wrong.

Hope this fix was helpful. If so, I'd like you to drop me an EMAIL, since I'm curious as to just how many fried monitors out there had this problem. Also, if you're not able to make the repairs yourself and live anywhere in Islip, Long Island, NY area, send me E.Mail and maybe I can help you out. My GE mail address is R.CONSTAN, or Internet: rconstan@maestro.com.

999. Atari Software

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-21 15:34:24 UTC
From: trumpet-user@csi.uottawa.edu
Message-ID: <trumpet-user.9.761844864@csi.uottawa.edu>
Source record: 34432

Greetings
I am wondering is there is a software version of TOS 2.06? If so
could someone tell me where I could find it.

I am also interested in a CAD package that specializes in printed
circuit board design and electronic schematics. PD prefered but I'm not
opposed to a commercial package that is robust.

Also is there a CAD package specializing in model railroad
layouts?

TIA
Chris

1000. Wanted: MegaSTE schematic

Newsgroup: comp.sys.atari.st.tech

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I post this once again. I have found someone that can sell me back issues of various ST euro publications (Steves Atari Store in CA). I just need to know the month and year of the issue I am looking for (though I would not turn down an offer for a Xerox for some cash, of course). If you remember seeing this or any other good discussion of the MegaSTE model, please let me know what magazine and issue it was in. Thanks in advance.

Wanted: back issue of ST Format that had a review of the MegaSTE. Included was a schematic of the motherboard. I am looking for:

1. What the exact issue of the magazine is (i.e. July 92).
2. A Xerox copy of the article.
3. The article.

Thus, I am willing to purchase this magazine (or even a copy of this particular article). Alternately, we could work out some other favor/trade (pints of my blood?).

Also, can anyone point me to other MegaSTE articles (preferably with lots of technical info, like what chips are where on the motherboard)? I am interested in any and all I can get, excluding those in Current Notes (I have all of them). I presume some of the other Euro ST magazines also had reviews when the machine came out.

Thanks in advance.

> thanks in advance!

I believe the answer is no. However, I just got an interesting ad for a product called TurboRS, which is a small board and some software that will yield 115kbaud on STs (and presumably STEs). I'll put the text file up for anonymous ftp on ftp.math.fsu.edu (192.12.122.28) in /pub/atari/turbors.zip. It is only about $40, well worth it given that it does what it claims. The authors are on the Internet if you have questions.

There are numerous hardware hacks that one can do to up the serial speed, but virtually all of them are

a) at the "chips and little components" level, and
b) in German :-)

Given that I understand the advertisement file, TurboRS is a little board, not separate components, and is produced by a couple of Canadian folks so all the docs are in English.

I don't own the product, I have nothing to do with it, etc. It does sound interesting, though. If it can smoothly interface with Connect (like RSVF), I'll be _really_ interested. Ftp the file and check it out (others are welcome as well).

No - you need a higher clock frequency at the TC/RC-input of the MFP,
because the frequency wich is used for the 1040STE MFP allows 19200bps
maximum.

Ciao, Arno

From: aw@zaphot.abg.sub.org
Message-ID: <Up-EBVTAHUX@zaphot.abg.sub.org>
Source record: 34436

Hi All,

I've got an used SM124 (manufactured 1989). Does anyone know, how i
can modify the "hardware" to get a lower "sub bright"-level ? I tried
to adjust it to the lowest level (internal - not external by using
the "bright" and "contrast" controls !) - the "black" background is
still very bright and only gets dark, when i also adjust the "B+"-value to
a low level ... but then the visible picture is really "tiny" - only
a quarter of the screen :-(.

Maybe i only have to replace some resistors or condensators ? Any idea ?

Thanks - Arno

KO> hard disk with ID 7?

None of the software included with your Falcon will. HDX stops polling for drives at the first "empty" ID it finds, so in order to have a drive with ID #7, you'd also have to have #0-6 plugged in.

The only obvious solution to me is buy the ICD Pro series software - it can be set to look for certain IDs and polls for all.

I believe I should be able to provide you with whatever information you need.

The board is small (about 1.5" square) and requires 6 wires to be soldered
to your motherboard, as well as one pin cut (on the MFP). It allows all the
standard baud rates, and adds 38.4K, 57.6K, and 115.2K.. The faster rates are
accessible via the standard Rsconf call, as rates 16-18. It also allows
remapping any other rate to one of the new rates..

I'll have to look into this RSVF thing, if it's some standard way of
implementing non-standard rates/hardware..

> It is only about $40, well worth it given that it does what it claims. The
> authors are on the Internet if you have questions.

That would be me and Daryl (drichards@isle.waterloo-rdp.on.ca). The board does do what it claims, but not 100% reliably. Due to the fact that TOS disables interrupts on a whim at every conceivable opportunity, the ST's serial routines lose characters at 38400+ baud. The hardware reliably provides the baud rates, the ROMS cannot reliably receive the characters. The only program that supports it well is our own program TAZ, and even it drops about one character in every 10k or so. More if you're typing (thank you TOS). We could write ridiculously militant code to prevent this, by-passing TOS 100%, but that would be unethical. As it is we bypass it for serial, to make TAZ RTS/CTS reliable under all conditions, but that killed any hope of its running on the Falcon, which does not appear to use the MFP chip for serial (Modem1) as does every other Atari machine including the TT. As of this weekend our internal code for Zmodem is about 50% complete, this will bring decent 38400 baud transfer CPS rates to TAZ. Its slow going because Zmodem is so complex a protocol, at least when all of your code is hand written and optimized assembly.

* Machines with accelerators as low as 12MHz work happily with 38400 baud *

I have *NOT* tested TAZ with HSMODEM (mainly 'cause its docs are all in German and I can't figure out anything about it). With TOS2.06 and XYZ, the highest CPS rate I've gotten is 1600 CPS, regardless of what speed TurboRS has set my machine too. This was very disheartening...

--- Blatantly pleading mode on ---

If anyone can tell me anything about hsmodem, namely what is does and how it works so I can start testing it with TurboRS, it would be greatly appreciate.

--- Blatantly pleading mode off / Descriptive mode on ---

TurboRS is a small hardware upgrade for the Atari ST that generates new timing signals to the MFP chip for 38400, 57600 and 115200 baud. It also works as a 'feed through' for the existing timing signal so that lower baud rates work fine. It is controlled by the unused RTS outputs of the keyboard and MIDI ACIA chips, so you don't have to worry about YAUFFSCBS (Yet Another Upgrade Fighting For Sound Chip Bit Six). The software driver allows you to boost the TOS send receive buffer sizes, lock flow control and baud rates, and remap any of the ST baud rates to any ST or TurboRS rate allowing full compatibility with existing software. For software that bypasses the tos serial routines, there is also a hardware lock rate mode, which can only be over-ridden by particularly nasty software that reprograms the ACIAs.

--- Descriptive mode off ---

> Given that I understand the advertisement file, TurboRS is a little board,

If somebody doesn't mind translating them to German in their spare time, it
would be greatly appreciated ;-)

> interesting, though. If it can smoothly interface with Connect (like RSVF),
> I'll be _really_ interested. Ftp the file and check it out (others are

If Connect goes through the TOS serial routines, it should work just fine. If
not the hardware lock option should *make* it work. Bwahahahahhahaaha...

Thanks for posting it, it is *GREATLY* appreciated. I've been meaning to
post it to comp.binaries.atari.st, but haven't hunted down a copy of zoo yet.
That and my feed is mail/news only, no ftp... Sigh.

You wont regret it. It won't feel like the major upgrade it is until you get an SVGA or better yet a multisync & blowup for it. When I first got mine, I was running on my old monitors (sm124/Philips color) and was a bit dissapointed by the screen. Now I'm running with a Multisync/Blowup/NVDI and it's wonderful!

|> Anything else I should look out for?
Yes, the GEMd version of Nethack. Almost worth buying a Falcon for :-) Winrec is a nice D2D program which is worth checking out. If you use Lattice C, upgrade to 5.6. It works on lower revisions but only 5.6 includes the newer libs. What do you intend doing with your Falcon? What you should get depends on that a little!

|> improve my SM125 display now, and improve my SVGA display later?
There is a PD program called Falcon Screen which is a software only screen expander. I haven't used it since I got BlowUp so I can't recall if it will help with an SM124. It's normally called fs.lzh or similar.

NO! You have the wrong driver. With HSMODEM it is possible to get
3500 cps with 38400 and absolutely no lost char on a stock 8 MHz ST,
with RSVE-board or other MFP clock modification (with CoNnect internal
Z-Modem).

>* Machines with accelerators as low as 12MHz work happily with 38400 baud *
see above! Accelerated can work with 115k, 8 Mhz with 57600 and 38400 bps
without problems.

Hsmodem can run with it. You even dont need a hardware modification to use
HSMODEM. For plain ST I recomend HSMODEM1 for all other's (Mega STE, TT and
Falcon the newer HSMODA versions).
Simply put it in your AUTO folder. The 'new' version can be set up by the
SETTER.TTP program. If you don't have that setter.programm put a small
file in your AUTO-folder (togehter with HSMODEM1.PRG) called HSMODEM1.INF
This file is plain text. Otions are NO GEMDOS, NO FASTINT or
SPEED MODEM1 baud1:baud2
On all 'normal' situations you will not need this INF-file. Only with
MiNT or MAG!X you may need NO FASTINT (which means no fast interrupts).

If you want maximum throughput don't use
any screen-acceleratos like Warp9 or so.

>If somebody doesn't mind translating them to German in their spare time, it
>would be greatly appreciated ;-)

>If Connect goes through the TOS serial routines, it should work just fine. If

CoNnect test's how it can get the data. If there are GEMDOS routines
present (like with HSMODEM or MiNT) it uses them. If not, CoNnect uses the
BIOS routines.

Bye Wolfgang

Jerry,

Well, he does have a few valid points, but in general I think he's
just blowing his horn. I'm not a programming expert, but I've read
the PowerPC instruction set and architectural definition. I know and
understand the hardware interfaces of the 603 and 604 enough to be
considered an expert, and I spent nearly 3 months studying the 620's
bus. I'll try and respond to Mr. Maple's comments by interleaving
mine with his. You may post this to the Atari newsgroup if you'd
like, but be sure and preface it with this paragraph. The views that
I express are my own and are not the official views of anyone other
than myself! ;-)

BTW, I will not be available to respond to any follow-ups to what I
say here as I am leaving at noon on Tuesday to fly to San Fransisco
to attend the WinHEC '94 at the Musconi Center.

I saw the very first 603 run on a printed circuit board. I saw the very first 604 run on a printed circuit board. (No, that's not a typo.) I think I have a pretty good idea of what kind of performance these chips are capable of. I'm drooling all the way to the stock broker to buy as much Motorola stock as I can. (Of course, Motorola stock prices are mainly dominated by the Communications Sector. That's my reality check!)

>]First of all, we have to remember that in spite of being made by
>]Moto (traitor! ;-) the original design is IBM, ergo - garbage by
>]definition, particularly in the areas of software and hardware.
>]Other than that, it's OK... :-)

Thanks for the vote of confidence for Uncle Mo! The 601 instruction set was defined by IBM. The 601 is a one-chip implementation of the 9 (?) chip implementation in the original Power processor found in the RS/6000 workstation. I believe that the 601 did not implement ALL of the Power instructions.

The PowerPC architecture and instruction set was co-developed by IBM, Apple, and Motorola here in Austin. The PowerPC instruction set is a subset of even the 601 instruction set. Therefore, the 601 has several instructions that are not part of the official PowerPC instruction set. I guess the architects deemed that they weren't necessary at all or were used so seldom in systems that emulating them with a handful of alternate instructions wouldn't hurt overall performance any noticeable amount. Also, some of the instructions were tossed out because they used microcode or could not be "sped-up" by utilizing super-pipelining and/or super-scaler techniques.

So maybe some of the "garbage" was tossed out. I would think that the savvy software writers would avoid the "601-only" instructions so that it will also run on the "real" PowerPC implementations without any tweaking.

See "garbage tossing" mentioned above.

>]2. 20 Power 6000 instructions implemented on 602/3/4 which subsequent
>] PPCs such as 620 will not have and would therefore have to emulate

Also see above. BTW, what's a 602?

>]3. 47 instructions which 620 will have but 601/3/4 do not and some
>] instructions must, again, be software emulated.

I must confess that I didn't read all of the 620 Book IV document (which
describes the instructions that that processor implements in addition to
the PowerPC required instructions), but I would tend to think that Don
is referring to the 64-bit instructions.

>]And, of course, only a bozoid the magnitude of IBM can call a processor
>]with 200+ instructions a "risc".

At first reading the PowerPC instruction set looks awfully big, but then
you realize that the "Load 16-bits" instruction is listed separately from
the "Load 16-bits and Zero the upper 16-bits while you're at it" instruc-
tion! There must be well over a dozen "Load" instructions and well over a
dozen "Store" instructions! Anyone familiar with the 68000 assembly
language mnemonics would find this rather strange (the 68k User's Manual
described the MOV instruction as a single instruction).

>]On the hardware side the PPC looks impressive for about an attosecond.
>]True, 601/3/4 have the 88110 bus (Moto's own Risc) but 620 (and presumably
>]up) have a different bus. In "true blue" tradition the processor is
>]incompatible with itself which means you can forget any easy processor
>]upgrades. (Don't bother telling me 620 is 64-bit, I know.)

You are correct about the bus on the 60X devices. It is a "split" bus
where in a multiprocessor environment it is entirely possible to have a
seperate master of the address bus than the data bus at any given time.
The 60X bus is a 64-bit data bus that is "flow controlled" by the memory
subsystem. The 620 bus has a 128-bit wide data bus that is "flow controlled"
by the data provider (620 on a write, memory on a read). Furthermore,
the 620 bus is a "split transaction" bus where the processor puts out
a "tag" during the address phase, and when data is returned on a read
that has that same "tag", the processor knows that that data is what
it asked for earlier. Several bus cycles may be "outstanding" on the
bus at any one time. No, this 620 won't be an "overdrive" for a 60X,
but BFD. Sometimes to make a quantum leap in performance, you have to
break from the past. Anyway, the end user and programmers will never
know. (Which 68k devices would work on the same bus?)

>]Hopefully this will help cut down on PPC salivation. Please send flames
>]to advocacy (I don't read it) otherwise they will be gleefully ignored.

Maybe, maybe not! It's going to be a VERY interesting year. ;-)

1012. Alfa-Data Mouse Behaving Weirdly

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-22 13:14:44 UTC
From: emdu02@castle.ed.ac.uk
Message-ID: <CLMnGK.4KM@festival.ed.ac.uk>
Source record: 34194

I recently bought a new alfa-data mega-mouse 2 to replace the now knackered 4 year old Atari mouse. The mouse is generally fine, but when I move it fast it seems to jerk and bounce back the way it came. Other than that it seems fine. Could anyone tell me if this is normal one a STe before I send it back.

Help appreciated.

Alan Swanson Email: emdu02@castle.ed.ac.uk

"Under the most rigorously controlled conditions of pressure, temperature, volume, humidity and other variables, the computer will do as it damn well pleases."

1013. Falcon math coprocessor

From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1638@usdtsg.DaytonOH.NCR.COM>
Source record: 34196

I've just bought a used AlberTT for my MegaSTe, and I find that
my multisync/scan monitor doesn't seem to sync up with the card.
(the card has a horizontal frequency of 48khz (or hz, I forget) whereas
my monitor only goes up to 35 horizontal). Is there an easy way
to get around this? i.e. some kind of circuit to take the horizontal
freq pin of the VGA plug and convert it to 35 or less?

Or will the 800x600 kit for this card use a lower freq? Post,
or leave email, and thanks in advance...

Rob

1015. 3D windows on Falcon030

Newsgroup: comp.sys.atari.st.tech

avsec@westminster.ac.uk (Philip Shore) writes:

>Is there anyway to boot up the desktop with the 3D windows without using the
>CPX control panel ?
Well, the Falcon always uses the 3D windows. Do you mean the colors of
the windows? If so, they are set up with a cpx (window color?).
There is no way to modify this with an auto folder programm.
This programm would have to use aes calls so AES have to be present.
But why not rename Xcontrol as *.app and install it as an auto run
application? After your system is present you close the window and
all memory should be freed. Is that you want?

> I'm looking for a defragger program for my Atari ST (TOS 1.4). The program
> must be able to handle logical sectors > 512 bytes. Any suggestions (program
> name & FTP site would be perfect)?

For TOS filesystems the most reliable (not the fastest) one is CHKDISK3.
You'll probably find it at atari.archive.umich.edu, ask archie for an
exact location.

For Minix filesystems you need MFSDEFRG, which can be found at:
ftp.uni-muenster.de:/pub/atari/Mint/Filesystems/mfsdefrg.zoo

Regards,
Waldi (walra%moacs11@nl.net)

PS. Can someone who owns a Falcon confirm/deny that CHKDISK3 can also
handle TOS filesystems with only one FAT ?

Just use any switch on the live line of the mains for the power switch!
(also if you are paranoid, put one on the neutral) Than you can put it
where you want...

As for resetting, would not the keyboard resets do the job for you?
(CTRL-ALT-DELETE)
Also, you could make a physical switch involving a piece of string which
goes under the computer, and pulls a lever to activate the reset button.
Dodgy, but effective!

Well, other RISC processors exist and they are also impressive.
As far as I know (I don't know much about 60x, x>1), except for
marketing reasons, the PowerPC doesn't have much more potential than
POWER or MIPS or ALPHA or HPPA or SPARC or ...
Especially given that the architectures are basically very close (same
number of registers same kind of addressing modes, ...)

> >]First of all, we have to remember that in spite of being made by
> >]Moto (traitor! ;-) the original design is IBM, ergo - garbage by
> >]definition, particularly in the areas of software and hardware.

Hahaha !! good start !
What exactly do you know about IBM's prestations except being the
originator of the big PC-mess industry (I know IBM should be ashamed
of that, but he's not the main reason of the mess: he never intended
to used the ISA-bus with a 386, for example)

> >]When it comes to instructions PPC (PowerPC) is a mess! As I wrote in

Well, given the PowerPC is supposed to be another architecture (though
partly compatible), it's not that bad: MIPS code is much harder to
run on a SPARC station, for example.

> >]2. 20 Power 6000 instructions implemented on 602/3/4 which subsequent

see above

> >]3. 47 instructions which 620 will have but 601/3/4 do not and some
> >] instructions must, again, be software emulated.

Is upward compatibility a bad choice ?
Do you mean the PowerPC should be totally frozen and never evolve ?

> >]And, of course, only a bozoid the magnitude of IBM can call a processor
> >]with 200+ instructions a "risc".

Hahahaha !!!!!
One more "sentence of the week" !
Only an total ignorant of computer architecture could say that !

- First: how do you define the number of instructions ? don't forget the
68030 has about 50 opcodes and 50 addressing modes, so that it's
number of instructions is of the order of 2500 (well, some
instructions don't allow all addressing modes, but others can combine
two of those addressing modes so I think my estimate isn't so far from
reality). That's 10 times more !!
- risc isn't about the number of instructions but about the kind of
instructions (especially the addressing modes). Most other RISC
architectures also have between 100 and 200 instructions.

> >]On the hardware side the PPC looks impressive for about an attosecond.

> >]upgrades. (Don't bother telling me 620 is 64-bit, I know.)

So blue tradition is "incompatible with itself".
Of course, that's why the 360 architecture is more than 30years old
and still selling.

Oh well, he probably believes that pentium is a CISC processor with a
RISC implementation !

1021. Re: Updating gdb for Ataris?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-22 16:54:30 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <2kddc6INN15l4@rs1.rrz.Uni-Koeln.DE>
Source record: 34203

I like gdb a lot -- many thanx to Andreas Schwab for the port.
There's one problem I frequently run into, though, for which gdb
cannot be held responsible: The problem occurs when I debug a GEM
program. The program may have the top window and do a
wind_update(BEG_UPDATE) . If gdb writes a lot of output (to the
shell window), it is halted temporarily when some buffers are
full. Now, if gdb is waiting for a keypress (e.g. because of its
pager), I cannot top the shell window to give it that return
keypress -- the system is caught in a deadlock, I have to reboot.
Likewise, the system hangs if gdb cannot continue to run the
inferior program when the output routine waits for the buffers to
be cleared, but this cannot happen because of a
wind_update(BEG_UPDATE) executed by the inferior process.

Questions: (1) Is there, by any chance, an undocumented keypress
that unlocks the screen?
(2) Or any other method of working around this problem?

Greetinx & thanx in advance, Jan

The Alfa Data mouse has a switch underneath it that can be wet to
an Amiga and an Atari position. Your problems may result from
your mouse being operated in "Amiga mode". I seem to remember
that some odd phenomena resulted when I tried my Alfa Data
trackball in Amiga mode on my TT.
Other than that, it should be noted that it is normal that the
mouse pointer moves in the opposite direction when the mouse is
moved too fast. This is true for the standard Atari mouse as well
as for all others I came across, but it happens at slower speeds
with higher resolution mice. The Alfa Data mouse is a 290 dpi
mouse as far as I recall, so the effect may very well set in at
speeds you're used to from your old mouse. In this case, just
take it easy -- youll get used to the higher resolution in a few
days or weeks.

Message-ID: <2kdibq$3g3@charm.magnus.acs.ohio-state.edu>
Source record: 34207

I am using Lattice C on a Falcon. There's the background.

I am trying to write an XIMG save routine. I have serious problem though.
When I create images with my routine GemView doesn't recognize them. If I try
it in a mono format, it reads the header fine but then during loading it goes
wrong XIMG format and dumps my img out as a plain Hex dump.

I am using the Atari sanctioned method of compression (i.e. each scanline
throughout the planes before the next scanline).

Since this is my first version I am also trying to do it uncompressed.
I.e I am setting the first byte of the scanline info to 0x80.

I have the Atari Compendium and am using its info.

Any ideas? This is getting frustrating.

>best.

You'll just need a standard, 8-bit single-ended interface, passively (or not at all) bus-terminating, 512 bytes per sector SCSI (I,II,III) drive.

I couldn't find ONE drive with these specs that didn't work on Falcon030 machines, from old 20 meg Conner drives to high-performance gigabyte bricks.

For HD recording, get the fastest one you can afford. Drives like the Quantum LPS540 (540 MB, 9ms access time, 1800 KB/s throughput) or Fujitsu M2694ESA (1.08 GB, 8,5 ms, 1900 KB/s) are absolutely required for full eight-track operation.

Atari driver AHDI 6.061 is not as fast as can be in WRITING data - third party drivers (e.g. HuSHI from Hard&Soft, Germany) are a lot faster on some drives, while not being faster on others. I've noticed it being about 30% faster on a Seagate 3655N drive, and no faster on the above Fujitsu drive.
Anyway, the tools coming with this driver make it a "buy", faster or not.

bye, Peter

It makes no sense copying AHDI.PRG in the AUTO folder of drive C:. How
do you think is this the AUTO folder found without an installed
harddisc-driver? The harddisc-driver is called C:\SHDRIVER.SYS and
gets executed by a program in the rootsector of the harddisc.

Just delete it.

1029. PC Speed CPU

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-22 19:44:51 UTC
From: st39@unix.brighton.ac.uk
Message-ID: <1994Feb22.194451.26306@unix.brighton.ac.uk>
Source record: 34211

I have Compo's PC Speed IBM emulator fitted to my Atari STe, unfortunaly
it looks as if I have managed to blow the CPU on the board (the IBM
one, not the 68000). The booklet I received with the board is unfortunaly
back home in Norfolk (I'm at the moment in Brighton!) so I don't actualy
know what CPU the PC Speed emulator actualy uses.

Does anybody know? It isn't that hard to find out, it should say in
the booklet.

Your help would be gladly received as I could do with it running again
very soon!!!

MAny thanks in advance.

[gdb is blocked by the GEM because of the debugged program]

> (2) Or any other method of working around this problem?

There's one alternative. If you're lucky enough to own a second
screen, you can use a second ST (ST's prices are low enough so that
only the monitor is a problem), connect it to the first one and use it
as a terminal: you can then start emacs and gdb on that second ST and
in there launch your GEM program that will display on the first
screen.
That may sound over kill, but it's way cool !!
Of course, you need MiNT to make it work.

Especially our british friends may proove or give a comment to following possibility to put an ATARI into an ethernet network:

There is a Low-Cost-Ethernet-Card to put on the ROM-Port which can be bought at:

Ladbroke Computing
33 Ormfkirk Road
Preston, LANCF, PR1 2QP
Tel.: GB 0772/56 10 71
Fax.: GB 0772/20 31 66

This card costs 70,- british Pounds and includes the PowerNet Software.

Please tell me, if this is correct. I'm not able to proove these statements.

> maximum.

There is sort of a way. If you turn off the /16 bit (bit #7) of the UCR
parameter to an RSCONF call, you can get 38400 through software by asking
for 2400. The problem is that the receiver only samples once per bit, instead
of the usual 16, so it drifts in and out of sync. Its great for transmitting
at higher speeds, but not so great for receiving. Its been known to work well
with Zmodem and Ymodem null transfers, but is really really not so great for
receiving (ie: Sometimes the receiver even locks up. Not sure why).

There are some useful things for getting your Falcon underway. Look for the German program NVRAM, which lets you adjust your Falcon's non-volatile RAM parameters (it's a CPX). If you have a fast modem, the shareware program CONNECT (ver. 2.45 is out in English) will give you high-speed serial access. Everest (the editor) is a shareware program that lets you use speedo GDOS fonts and large screen areas. Master Browse 3.5 does too, for a replacement file lister.

I can recommend True Paint if you want to use True Color and view JPEG images. I've had the best luck with the demo of BlowUp for graphics expansion, but I'm currently using a multiscanning monitor. I understand you can tweak the Atari Monitor some, but read the documentation thoroughly before trying that. Some frequencies can be very unhealthy for monitors that aren't designed for them.

In the fun department, look at Graphical NetHack -- very addictive and great at VGA resolutions. There's also TERMFIN, another DSP sound program like FALCD2D only more elaborate. LaserDemo can be downloaded in pre-release form; it's good fun. For some interesting demos, check out PENTAGON and CHROMEDR, they show off some of the bird's abilities. Oh, and you might not want to dispense with SAM so quickly; it has a lot of interesting capabilities if you have the RAM to spare. Did you know that it can use MS-Windows compatible .WAV files? Handy.

Good luck getting things going. Oh, one more word to the wise; if you want to do much with different hard disks, get the ICD Pro version of their hard disk utilities, and get rid of AHDI. You'll be much better off.

Well, I have yet to see anyone mention it . . .

Lharc 2.99 was recently uploaded to atari.archive.umich.edu and other sites.
It is great! The big upgrade over 2.32 is the inclusion of a GEM shell
similar to ST Zip's (it has lots more options though). I particularly
like the estimates of compression/decompression time, and the bar graph
style progress display. The shell is installable as an application. This
appears to be a must-have program.

Oh, the only weird thing was that this new version is contained in a
Zip file?!?

Last month (end of january) there was a computershow, where they sold 68881
and 68882, their prices were $10 US dollars for a 68881 and $40 for a 68882.
But these are the prices in The Netherlands (Europe).

I bought a 68882 there.

Installation is really no problem, open up your falcon, remove harddisk, and
you will see a maths coprocessor socket. Just plug it in, and the thing is
installed.

Well this is a report of Terminal programs that have built in Auto Zmodem
and if they work with Omens Complimentary version of Zmodem 4.7 dated 29-11-93,
that is on this VAX/VMS Sytem here....

This Zmodem only works with built in Auto Zmodems, so FZT is out plus a few
others.....

The Programs tested were FLASH 2.2, THE STORM 1.02, STALKER 3.02 and
CONNECT 245E..

A small 10k Zip file was used for all the tests, the first test was to see if
they all worked with the Older Zmodem that is on here 1987, but don't have the
version number at present...

All dnloded that file OK...

I then selected the Later Zmodem V4.7 Dated 29-11-93, all but one failed
to dnload that files and gave timeouts, this was done after testing the 1987
version and deleting the dnloaded file at my end, each time..

The only one to work 100%, each time was THE STORM 1.02..???

So don't we have any Real Comms Programers out there...:-)....????

I don't know if its posible to test GSZRZ 3.4 in ay way, if any one has a way
please let me know.....

NOTE: A lot of people that use this Public Site have had lots of problems with
this New Zmodem, These are PC Clones user I might add, but it does work with
Omen products on PC Clones....

|> (2) Or any other method of working around this problem?

Try placing a breakpoint on wind_update and set up some commands for it to bypass this call (with `jump', IIRC), so that this will never execute.

Another option would be to redirect the i/o of gdb to the serial port and use another computer as a terminal.

Simply plug it in. The socket is under the power supply. But be aware that
only very few programs support a floating point processor. Programs have to
be compiled with special compiler switches otherwise they won't profit from
it.

> I want to install a 68881 math coprocessor in my Falcon. Can anyone
> give me info about:

You should not get a 68881 for your FALCON. Get a 68882 instead. They're instruction compatible but the 68882 is much more integrated (faster!) and not much more expensive.

> (a) the current price for this processor

I got a 68882/25MHz for DM 100 (US$60). That's really cheap. I got the 25MHz version because if I would buy an accelerator, it should make no problems using it with 32MHz. If you don't intend to buy an accelerator for your FALCON, you should get the 16MHz version (cheaper).

> (b) the installation procedure for the Falcon

It's easy. Just open the FALCON case and remove the mains adaptor. Under the mains adaptor is the socket for the FPU. Find out the right orientation and press until you hear a 'klick'. After closing your FALCON you should check if the _FPU Cookie is set correctly. That's it!

Source record: 34230

Hello folks,

I'm trying to figure out how to compile programs written in
assembler exclusively with gcc. I get an object without errors,
but I cannot seem to come up with any method to convert that into
an executable. I know that this is normally done by the linker,
but

gcc-ld foo.o -o foo.prg

gives me a "bad string table size in foo.o" error message from
ld. The same happens if I try

gcc foo.s -o foo.prg

My test program looks like this:

```
.text
.even
clr.w -(sp)
trap #1
```

What am I missing?

Greetinx & thanx in advance, Jan

I am attempting to change the floppy drive in my 1040. I removed the factory installed, CHINON F-354EAT, (double sided, 720k) drive.

I have here to install into my ST a TEAC FD-235HF, which is a 1.4 meg drive, taken out of a PC clone. This drive does not work in my ST when I plug it in, and I also noticed a set of jumpers on the TEAC. Do any jumpers on the drive need to be moved for it to work properly on the ST?

This is how the jumpers appear:

```
E . .
D X .
C X .
B . X
A . X
-------------
2 1
```

The jumpered pins are:
(C2,D2) and (A1,B1)

Thank you in advance for all your help..

Source record: 34233

Hi, I have a Falcon030 and use an SVGA monitor with an Overscan screenblaster...

Now the problem is that this little gadget (the screenblaster) claims in it's manual to do such things as 800x608x16 on an SVGA monitor... not on mine it doesn't... Also some of the other resolutions that the manuals mention and that have SVGA compatible scan rates don't work on my monitor either.

By not work I mean don't appear in the selection list at bootup/res change time.

So can anyone clear this up ? Perhaps I need a newer version of the software bit (mine is I think v1.01). The monitor I use can handle 31,35,38 horizontal incase that makes the difference...

If I can't get 800x600 (a nice aspect ratio you see) then I'll probably have to sell the screenblaster and get a BlowUp030 thingy...

Cheers

1052. Never hit your computer! (Was Compo's PC Speed board)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-23 15:16:01 UTC
From: st39@unix.brighton.ac.uk
Message-ID: <1994Feb23.151601.16954@unix.brighton.ac.uk>
Source record: 34234

Thank you to all who mailed me with the name of the CPU on Compo's
PC Speedn board.

Unfortunaly, as well as killing my PC board, I also seemed to have done
some damage to the ST. This morning the ST ran for about 2 mins until
it bombed out and Protext reported a 68000 exeption error. I took the
lid off and gave each pin in the 68000 socket a wiggle. The ST then
worked, for about 2 hours when it bombed again for the same reason. Now
it is bombing out after about 2 mins again, this time it reports a
bus error sometimes.

As well as this, the floppy disk (internal) light is flashing on and off
fast (kind of strobe effect) - is this some sort of signal trying to
tell me something?

Any help would make me very happy! I plan to have another go at giving
each connector in the socket a wiggle, is this wise?

This all means that if you were expecting issue 18 of PDP Magazine to be
out by the end of next week, you may have to wait a little longer!
Fortunaly our Amiga is still working! But because of this, a number of
articles are on my Atari waiting to be DTPed and now it looks as if the
Amiga will have to have a go! Sorry for this!

Anyway, any suggestions/help etc....

: Thank you in advance for all your help..

: Fred Moskowitz
: moskowif@dunx1.ocs.drexel.edu

The only thing I can say, is that the most common cause of the drive not
working, is the ID... IBMs put both on 1, and twist the cable.. The ST puts
it on ID 0... Some drives have a switch.. Otherwise, play with the jumpers..

I have been using it for the last few weeks and the user interface is very
good. However, I found that it doesn't like to compress very large files,
or a large number of smaller files. It simply aborts halfway.

1058. KA9Q (STICP) and 19200 Baud?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-24 07:23:34 UTC
From: kai@kub.escape.de
Message-ID: <940224314@kub.escape.de>
Source record: 34240

Somehow i failed getting ka9q (sticp version from pe1hcl) to work at
19.2 kbd on my plain st. 9600 is no problem. I already had a quick look
at the source, and suspected that disable()/restore() blocks interrupts
too long at the higher baud rate. I patched the binary (recompiling
would take me hours) and removed all occurences of that, to no avail.

Does anyone knows what's going on here? Why is ka9q constantly dropping
bytes at 19.2 kbd (i can't get a single packet without errors!)? I tried
other ka9q ports as well, same problem.
BTW, plain zmodem file transfer works fine for me at 19200, so i
suppose it can't be a general problem with my setup.

I'm kind of stuck here without a very close and timeconsuming investigation.
Has anyone already solved this particular problem?

|>
```

Well, there are two ways to do what you want. First of all, you can do everything yourself (install your own stack, check for args etc), then you just link with the option -nostdlib to avoid linking the standard startup code.
The second way is to use the startup code from the library, then you have to name your entry point accrodingly (main), but be aware of the "_" the c compiler puts before every name, so you have to name it _main
Maybe take a look into the source of the lib to determine which other name could be best for your purpose.

Regards
Ulrich

The floppy disk lights always flash on and off. It does that because TOS checks
for any newly inserted disks every 50th, 60th or 70th of a second and has to
activate every connected disk drive to do this.
Normally you can't see this because it flashes very quickly but if you pay
really close attention (or when it's dark) you can see.

Does anyone here know of a program that would allow
me to connect my 1040 STe to a PC. My roommate has
a program called EBOX that allows him to access the
drives on one machine on the other as if these drives
were installed in his machine. I would like to do this
so I can use his 14.4K modem to download files and then
copy the files from his drive to mine (720K floppies and
2Meg files don't mix). Another option would be to connect
the serial ports (NULL-MODEM?) and use comms program to
transfer using Z-modem. If this is possiple , what
comms progs do we need and describe the connection.

The EBOX type connection would be prefered if possible.

Ian,

you've answered your own question. To a first approximation, a 60Hz
field and 800 lines is a 48kHz line rate. At 70Hz (rather better on the
eyes) it's 56kHz.

Unless you're heavily into eye damage and headaches then it's far better
to beg (not steal) buy or borrow a multi synch monitor that goes up to
serious line rates! Try it, you'll be amazed... then, of
course, you'll start to think about 15" or 17" or larger screen sizes to
fit all the pixels in comfortably!

Good luck

You have to install the right monitor type in the sblaster.inf file. There is a program for but I don't remeber what it's called. If there is a normal VGA type installed then you will indeed not get all the resolutions available.

Wrong. AHDI can be configured to scan only certain drives. More information
you can find in the AHDI Release Notes.
BTW, there are several other drivers that have obvious solutions for that,
e.g. HuSHI and HDDRIVER.

I don't know where "Allanon" is, and safe practice does depend on the
mains distribution system. What I really must comment on is Steve Taylors
irresponsible reference to the *safest* practice as being for the paranoid.
In the UK, the PME system means that it is possible for the neutral line
to reach the same potential as the live under certain fault conditions.
Double pole switches cost little more than single pole and are worth it,
especially where the equipment is left permanently attached to the outlet.

As I recall, fopen just returns 0 or NULL doesn't it? Why the typecast to
(FILE *). That looks like the root of your problem, IMHO ;)

Michael

I'd say do this. BlowUp seems to be much more versatile. Try mailing
compo@cix.compulink.co.uk first though to see if you can get an updated
Screenblaster

Some friends and I were talking and we cam up with a great project for someone (we are all unfortunately too busy). That is a program that would play .seq files and/or .avs files in a window on the desktop. This would be really nice if it ran under MTOS and on a Falcon or TT.

We know that there are programs that will do this that take up the whole screen, but this isn't what we were talking about it. It would be a great way to resurect those old avs and seq files. It just seems kind of a waste to have 1200x800 with 16 colors and not be able to play a litle 300x200 16 color animation in window under MTOS.

Well that's our idea. Anybody willing to take up the ball and run with it?

: with a huge SCSI-2 cable, etc. This half gig drive is configured to
: SCSI I.D. 7. At present it is impossible for me to change it's ID to 0.

: My Falcon won't recognize it: It boots up and says "Couldn't find device 0".

: When I try and run any of the Hard Disk Utilities (HDX, HDutils, etc) they
: just print to the screen something really fast and exit. We don't have a CLI.

: The Big Question:

: How do I get ANY of this software included with my Falcon to recognize a
: hard disk with ID 7?

: We've tried everything. The manual says nothing. Comp.sys.atari.st.tech
: must say something?

: Thanks, friends. Email to brunos@mafalda.math.mcgill.ca

This most likely won't work... You sure the drive is at ID 7? Most hosts live
at ID 7... Usually, only IDs 0-6 are available... So, until you change the ID
to something other than 7..... Too bad...

Also, as far as I know, Atari's software skips out at the first unused SCSI
ID.. Meaning, it'd have to be 0 to work...

1082. TT SCSI setup

Newsgroup: comp.sys.atari.st.tech

Okay, guys, I need your input here. I just received my parts and put together an external SCSI expansion to my TT via its external SCSI port (yeah, that DB25 thing). I bought an enclosure and put in a Quantum LPS 540S and an Archive 2150 tape drive. The two devices are set up as SCSI devices 5 & 3 respectively. The problem is, my TT doesn't recognize the presence of these devices. (The parity function of the LPS was disabled. Otherwise, the system won't even recognize drive C.)

I'd boot up and AHDI 6.0 would say device 0 (internal HD?) is on, but device 1 is not responding. It's always been this way since I got the machine. Of course, it also says that ACSI devices are not responding. The LPS is the first device in the enclosure, and the tape is the farthest one. As a result, the terminator resistors on the LPS is removed while that on the tape is left on. This should be correct, right?

I've tried the setup both with and without the ballast resistors on the internal HD. Didn't make a difference. Which should it be? Is there something else that I need to do? Such as flipping a dip switch?

This machine has 4MB ST RAM and 16 MB of TT RAM on a GE-Soft board.

Clarence

ps. Uwe, are you still monitoring this net?

1084. TT 19" monochrome QUESTIONS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-24 21:54:04 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLr0u4.452@watserv2.uwaterloo.ca>
Source record: 34066
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I finally took the plunge, I am getting a TT (used) this weekend. I bought a 19" Moniterm VY1000 mono monitor for $100 at a surplus store (it also included an AT graphics card with 1meg of memory and cables).

Anyway, someone local here offered to help me try to get it working. I do have some questions (since I haven't talked to him in a while).

1. Is the monitor connector on a TT 9 or 15 pin?
2. Are the mono signals ECL or TTL (not sync, just video)
3. WIll i need to invert sync for a Moniterm monitor?
4. The monitor I have has a 9 pin input with the following pinout:
(the only manual I have is for the graphics card - and these are the specs)
1. Video1+ ECL
2. Video2- ECL
3. Video2+ ECL
4. -5 volt input
5. Horizontal sync TTL
6. Video1- ECL
7. GND
8. GND
9. Vertical Sync TTL

Anybody know what kind of problems I'll run into? Anyone know of any dip switch settings or jumpers in the monitor which may be useful? As i said, the above data is from the supplied graphics card manual (which is why there is a video1 and video2?)

I hope this works!

Thanks for any help,
Sam

1087. Extended GEM library - big gripe...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-25 00:02:01 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2kjf5p$464@uqcspe.cs.uq.oz.au>
Source record: 34069

Last night I installed the new LHARC 2.99 which has LZHSHELL.APP with it.

LZHSHELL.APP looked a bit ugly as it was all monochrome, so I though I would edit the RSC file and make all the forms 3D.

But alas, when I changed then, there was no change in the forms within LZHSHELL.APP. The only reason I could suspect was that LZHSHELL.APP was using VDI for ALL the objects in the form (ie. they were all PROGDEFs). This is ridiculous.

Can anyone using "Extended GEM" confirm this?

Can anyone doing this, stop.

PROGDEFs should ONLY be used for object types not already provided by GEM.

If I've misunderstood the problem, let me know.

Source record: 34070

```
Simple survey for GEM programmers:

1. Do you use a GEM library?

YES/NO:

2a. NO? Do you want to be emailed the results of this survey?

YES/NO:

2b. YES? Which library, or "my own" if you have your own:

Library name:
Author:
email:
distribution: (commercial/shareware/freeware/pd)

3. What are the major features you like about the library?

4. What are the major problems you have with the library?

5. Any other comments?

Thanks for your time, please email replies and I will post
a summary.

I'm interested in the results for a number of reasons. Firstly,
I'd like find out what additional features are best to add to GEM++,
and secondly, I'm interested in redistributing this knowledge to
new GEM programmers.

>others.....

Why does it have to be builtin??? I can't imagine any circumstances
where the host computer can even tell whether you have a Zmodem built in
or not. Also why does it have to be an auto Zmodem??

>I then selected the Later Zmodem V4.7 Dated 29-11-93, all but one failed

>
>The only one to work 100%, each time was THE STORM 1.02..???

Did you try varying the setups with CoNnect for instance??

>So don't we have any Real Comms Programers out there...:-)....????

Yes we do!! Just because a new implementation comes out and some of the
older software aren't compatible "out of the box" with it, doesn't mean
that there is any lack in the programming department. A lot of the comms
software for the Atari is of very good quality. At the _most_ all you
can say is that they may not have had the opportunity to catch up with
this particular implementation. It doen't really tell you a lot!

My experience with AHDI has been that it gives up scanning for devices as soon
as it hits the first non-responding target number. So, if you reset your IDs
from 5 & 3 to 1 & 2, it should then see them properly.

Sometimes I'd prefer that it scans all target IDs, but I guess this saves time
in the nominal case...

Well now that I've put the case back on the computer you can't really
notice it - not even when it is dark.

BTW- I got the ST working again, for anyone who is interested if you mail
me I'll tell you how, it's not at all interesting so I didn't bother
posting it here! :)

Many thanks for all that helped!

There is a Sub-Brightness Pot called VR702, this should be set were all the
other controls are set to full black, ie, backed off, and then you set VR702
so the scan lines can't be seen in a dark room....

1096. ST software supporting PPP

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-25 12:10:11 UTC
From: rowdyb@dutiws.twi.tudelft.nl
Message-ID: <CLs4Gz.3M4@dutiws.twi.tudelft.nl>
Source record: 34090

Anybody ever turned his/her ST into a machine to telnet/ftp etc. from
directly, using the PPP protocol over your modemlink from
home to university?

If so, please tell me what software is available for just that;
the comp.protocols.ppp FAQ speaks of no Atari software for this.

Even bleed'n Amiga's have it!

Curious to any responses, lies or songlyrics wrt to this,
here or in my box,
Regards,
Rowdy Blokland (The Netherlands)

>installed... so it ain't that.
>

You didn't say that in your message :-)

Anyway, if I install the best monitor avail. (multisync) Then I get to choose from all the resolution that the screenblaster can do with that monitor. (Even if my monitor can't do that one) So if you don't then there must be something wrong with the program, try getting a new one from you dealer... (I've got version 1.0)

NO. He didn't ask for 800*800, but only for 800*600. For 600 lines (you
disapproved your own answer =) you need only 600*60Hz == 36kHz.
But you still need some extra time for Vertical Blank. (approx. 5%, normally
calculated as 10% to be sure...), what gives you about 38 kHz.

>Are you absolutely sure about this? I have never noticed it, and after
>close checking now, it just ain't happening.

Yes, it was one of the first things I noticed when I got my ST back in '87.
Since then I have gotten a MegaSTE and it does the same.

If you really want to see it, turn of the lights (and your monitor) and watch
the busy light.

If your REALLY REALLY want to see it, do the above, but with an external
floppy drive. Adding the second floppy exagerates the "feature", plus the
flashes on the external happen ever so slighty after the flash on the CPU.
(I know why this happens, I don't need anyone to explain it too me.)

>
>So 1993 software is old, I think the main problem is that Programers are
>working with very old Zmodem source code, if you need the latest code you will
>have to pay for it, thats Omens way....!!!!

Not you - the customer. This meant a price increase of 50% to connect and
I really don't see a reason to pay for a 1 to 3% increase in performance a
price like this. The problem with Omen is, they even don't allow you to
use the new protocol options even if you built the source for z-modem from
scratch. CoNnect would be capable of Zmodem90 but some forced #ifdef's
disable this feature right now. In fact this also applies to Storm and
if it really implements some Z90 features the author has to pay most of
the shareware fee to omen.

Nevertheless Z90 works fine with any Z87 implementation but you'll lose
some 1 - 3 % of throughput. As autostart is no special feature of the zmodem
specification the next version of Connect will also react on the new
start sequence and run in Z87 afterwards.

Source record: 34142

Hello again,

The problem that I posted a few days ago is solved:

> gcc-ld foo.o -o foo.prg

>gives me a "bad string table size in foo.o" error message from
>ld. The same happens if I try

> .text
> .even
> clr.w -(sp)
> trap #1

It turned out that it is necessary to attach a global label to
the first assembler statement. Apparently, this label can have
any name. The linker seems to use the first label in the text
segment as the entry point and barfs if it there's no label at
all. It seems to me that using the first instruction of the
object in this case would make much more sense...
Other than that, it is necessary to specify the -nostdlib flag,
as pointed out by Ulrich Kuehn. Otherwise, the C startup module
will be linked and the linker will cry about being unable to
resolve the symbol _main.
Btw, I figured out the thing about the label by jumping to
conclusions from looking at assembler sources created with 'gcc
-S' and found in the mintlib sources. Does anybody know about a
more appropriate document dealing with the linker and the
assembler? For instance, I saw a lot of .stabs instructions in
the code generated by gcc, and I'd linke to find out what they
do.

Yeah my monitor has the following specs:

horiz scan : 31.5, 35, 38 (rough figures)
vert scan : 45-100Hz

Now the SVGA driver in screenblaster has the same horizontal scans but only 60 or 70 Hz vertical. Clearly my monitor is not being fully used. I tried pretending it was a MultiSync and selecting the resolution carefully. I got 800x608x256 _no_ problem. however I don't like this cos one wrong selection adn good buy 250 quid monitor.

What I need then is to get screenblaster to admit that my monitor can do more than just 60/70Hz refresh...

Oh well

Ian

The problem: Altough the sub-bright-level (yes - i used the pot VR702) was
adjusted to the minimum there where still very bright scan lines :-(.
I could only adjust the sub-bright from "bright" to "very bright" ...

But as i wrote in another article - i fixed this problem - thank you.

I believe 'stabs' stands for 'store absolute' which basically allows one to manually insert information into the symbol table of the object file (obvious really..... NOT! :) Its main use is for creating debugging information to be used by, for example, gdb. Another use is to give a C routine entry point multiple names. This is used to good effect in mintlibs when one function can be referred to by two different names to avoid duplicating code and hence wasting space.

Normally, you won't need to use stabs when hand-coding assembler anyway.

Cheers, Steve

1109. ICD SCSI Pro & Falcon: which version works?

Newsgroup: comp.sys.atari.st.tech

|> This machine has 4MB ST RAM and 16 MB of TT RAM on a GE-Soft board.
|>
|> Clarence

Change the SCSI id of your external drive, lps540, to ID-1 then AHDI
should recognize it. I personally use ICD's Pro software, but that's
personal preference.

My TT is configured as follows:
2Mb ST Ram
8Mb TT Ram
85Mb Seagate 1096 (TT SCSI ID 0)
425Mb Quantum LPS-425 (TT SCSI ID 3)
525mb Tecmar tape (TT SCSI ID 1)
Chinon 431 CDROM(TT SCSI ID 5)
NEC-84 CDROM (TT SCSI ID 6)

Only the internal drive and the last one in the chain are terminated.

Brian

Here are some sentences from the docs:

----------snip----------

Modular (Serial) Device Drivers
==============================

(Translated from German to English on 1994-01-01 by Harun Scheutzow)

This package contains serial drivers. For every interface or every
interface integrated circuit exist an own driver. The user has to deal
with selecting the right drivers, but the advantage to load only the
drivers he needs. Because I use a clean modular design, a special program
(DRVIN.PRG) has to be loaded before the real drivers. This program adds
the functions for driver installations, which are absent in the operating
system (TOS, Mag!X, MiNT).
----------snap----------

Harun (Harun_Scheutzow@b.maus.de) is the author/developer of HSMODEM, RSVE
and ST_ESCC. The latter implements two additional serial ports, working at
115200 Baud simultaneously on a 8 MHz (!) ST and could be seen as a
successor to RSVE.

Unfortunately I don't have ftp-access, so I don't know if it's available on
a.a.u.e. or any other ftp-server. Maybe a person who has access to both
MAUSNet and Internet can help.

Andreas

1115. Help! Compiling MiNT 1.08

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-26 17:04:14 UTC
From: scotty@verdix.com
Message-ID: <1994Feb26.170414.22951@verdix.com>
Source record: 34148

I managed to compile 1.04 without much trouble, but now I'm stymied.
I get to the linking stage for mint.prg, and it fails because the symbol
_xbios is referenced in mem.o but there's no definition for it.

I searched incl94 and incl95, and it isn't mentioned. I also tried compiling
with the version 94 and 95 libraries. This was using gcc 2.5.8. No luck!

Can it be that I need the version 97 includes and libraries? This seems
unlikely, since MiNT 1.08 sources have been out for months, and the version
97 stuff only started showing up this morning. The includes were on a.a.u.e,
but the library hasn't been posted in compiled form yet.

THANKS for any help!

Scott

I ordered ICD Pro from Toad a few months ago and got version 6.2.3; where
did you get one that old? The version I received works fine, once you figure
out how to install it.

The documentation for the Falcon is all on disk, and they use TT030 in a lot
of places where they mean "TT030 and Falcon". Other than that, it's a great
system and well worth the trouble!

Are you using TOS 1.0 or TOS 1.02?
Apparently the Shell has some problems with these old TOS versions; it
works fine with TOS 1.04 and 2.06...
(I'll send a bug report to the author tomorrow, just in case he doesn't
read this group.)

1122. TOS 2.06

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-27 16:34:33 UTC
From: vicb@clark.edu
Message-ID: <2kqi2p$18s@clark.edu>
Source record: 34155

I am in search of documentation or information that will tell me exactly what all of the differences are between TOS 2.06 and TOS 1.62.

The more gut-level the information, the better; programming compatibility is what I'm trying to achieve with a program of mine, and it doesn't seem to get along with 2.06 on one front.

Anybody know where I could get such info?

Thanks in advance,
Victor Bruhn
vicb@clark.edu

1123. I got a TT yesterday- Need suggestions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-27 17:27:16 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLw8HH.F35@watserv2.uwaterloo.ca>
Source record: 34156
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am soooo happy, I got a TT yesterday used for $1100 (canadian). It seems to be fine. Now, the questions:

1. It has TOS 3.01. I am getting the 3.06 ROMs (I don't know how long that will take) so does anyone one know a complete list of Tos fixes I should install till then? (Besides serial port stuff, I have HSMODA02)

2. Does anyone know of any TSR's or accessories I should avoid at all costs. I have my accesories in a folder called ACCs and am using ACC v1.3 (when not using Geneva) to have the desktop find them. This runs perfect on my Mega STe (TOS 2.05) but doesn't work at all on the TT. Anyone know of a similar program that will?

3. I don't want to boot off the internal drive! It's too damn slow! For now I hook up my external drives which the TT will boot from because the internal drive hasn't spun up when it is ready to boot. On resets, I have the ICD pro 6.2.0 utils on both SCSI 0 and ACSI 0 set up to ignore the internal drive (ACSI ID 8 to ICD). I guess the best solution is to take my Quantum from my external case and put it in the TT case and take the Seagate 48meg from the TT case and put it external. I assume the TT SCSI stuff requires disabled parity as well? Does any forsee any trouble this might bring?

4. Spectre is really nice on the TT (I just thought I'd throw that in) I hope 3.1 comes out real soon.

5. It has a low density drive. I assume in needs an AJAX chip to support HD. Is there anything else it needs for this (besides TOS 3.06) like jumper changes, traces cut, etc?

6. Any wanna buy a Mega STe with 4meg and no shifter chip problems (It was fixed by Atari Canada - 1040Ste shifter installed)? TOS 2.05 and low density drive and NO Hard disk. Also an SM124 mono monitor (the old ones, really crisp) Make me an offer. I will consider trade+money for a 1040Ste with 4 meg and no DMA problems. (A friend of mine wants a 1040STe)

7. I'm gonna need TT RAM soon. Everyone seems to recommend GE-Soft board. Anyone have any recommendations/caveats?

Thank you in advance! Please e-mail or post, I read the news fairly frequently.

As a work-around, if you're not debugging something to do with drawing
the screen, you could just leave out the wind_update calls (with #ifndef
DEBUG or something around 'em) while debugging. Your screen will be
messed up somewhat, but at least you won't need to reboot.

I have TOS 1.2 and I have found several problems. I, however, have resolved
them.

1) On files that don't uncompress all of the way, Just uncompress them again.
LHarc is weird, about 80% of the time it works, 20%, it doesn't. If, one file
doesn't uncompress, delete all the others in the archive. Delete works great!

2) Bombs bombs bombs! When extracting a file, you MUST extract all of the
files. Don't select certain files. If you only want a couple, delete the others
in the archive.

I hope this helps.

Flash (as done by Antic and Alan Page) ended with 1.6. There is another
product out called "Flash" that is not from the same source, and was pretty
buggy the last time I looked. The successor to Flash is STorm, by Alan Page.
It is a shareware product available from atari.archive.umich.edu. It was
introduced relatively recently, and looks as though it will develop into a
very nice product (though it appears somewhat rough around the edges at the
moment). I suggest you also try Connect (from the same site). It is an
excellent telecommunications program from Germany, also shareware.

If you don't have the Pro booter version 6.4.3, then you should get
it. It's the first version (to my knowledge) that allows a Falcon
to boot properly from _external_ hard drives.

There is also a newer version in the works, v6.5.0, that purports
to allow CD-ROM access without having to have MiNT installed.

GSZRZ 4.1 Support...!!!!

Hi I have noticed that the Demo version of
Michael Ziegler Zmodem version 4.1, they list
a few German and Swiss BBS sites that you can dnload the
latest version (4.1) if you are a registered user..

Has any one used these sites and was it for the complete version
or parts that you have to dnload each time....

The English Doc's are not to clear about this, and do you have to wait to
get validated on these BBS's, ie, to access these BBS's....

Thanks........

I am a Calamus SL user, have used Calamus 1.09 and Calamus 2.0.
There are some drawbacks on Calamus. The user interface is not
easy or straightforward. For text entry there are three ways to
do so.
However, if you use Calamus frequently this is not much of a
problem. For the rest, Calamus offers a lot of features for
a low price.

I use it almost every day.

Apart from the aforementioned software incompatibility, it's fine. When
the shop suggested I look at a tablet for less than 50 quid, I was skeptical.
But, after a quick play, I decided that it works well for drawing apps
(I use it with DA's Vektor). You can still use your mouse at the same
time for jobs that are easier that way.

The left-click method is quite neat; the `nib' has a microswitch, and
pressing slightly harder on the pen simulates a mouse click. By default,
right clicks are simulated by using a shift or control key at the same
time; this is less convenient, as many programs use shift-left click, say,
for some purpose. I need to spend some time with the configuration program
to get the right-click method to suit.

Hi,

I'm trying to find the author of the TapeBIOS software, Alan Hourihane. The email address for him in the documentation is <alanh@logitek.co.uk> but this is no longer a valid address - anyone know where he is ?

Thanks for any info. - email prefered but it's up to you ...

"I've just purchased an AlberTT graphics card for my MegaSTe,
but alas, I've found that it doesn't quite work with my
monitor. The card requires a monitor that supports 48khz
horizontal sync - "

"If not, what kind of monitors do actually support this rate?"
Ask for a monitor capable of supporting 1024x768 NON-interlaced. Most
current SVGA monitors can handle this, but few low-range (i.e., capable
of handling ST low and medium res) can.

Given the scan limitations of your Acer monitor, if the card could be
modified to work with it, you would have to be satisfied with approximately
800x600 resolution. I have no knowledge as to whether such a modification
to the AlberTT card is possible, however.

If you are refering to the Amiga modulator, there is no simple hack..

I have modded one to work on a Mega ST, it was simply for me as I am a Tech..

You need Real Composite sync and you have to change the xtal osccillator
in the modulator to work...

It does not use pin 2 at all...

Most ST's , Mega's don't have any thing connected to Pin 2 at all...

With the standard PC Speed emulator, that would be an NEC V30-8. (The -8 meaning rated for 8Mhz operation...you could always use one rated for a faster speed if you could not find the -8 version).

No, it doesn't do this (to the best of my knowledge). However, if I
understand the Enhanced GEM sources correctly, the AES 3D bits are
used for internal E_GEM purposes. There is some German documentation
which sort of suggests this, but my German isn't up to translating it
properly :-(

1153. AES sending bogus update messages!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-02-28 21:05:56 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Feb28.210556.14115@beaver.cs.washington.edu>
Source record: 34186

I've written a GEM program that has 3 windows open. One has a resource tree that I draw in it and the others have VDI lines and text in them. The problem is that I get these weird messages from the AES telling me to redraw a small box (about 10 characters across and 2 lines high, right under the menu bar) after topping one window, drawing it,
and topping the window I was in before. (This is when I click on a different window). There are no windows around this spot, nor have I called form_dial() over that spot to tell the AES to update it. I just seem to get this weird message. This happens weather I'm running on a Falcon, TT, or STE. Also, if I move the window to the right, it doesn't send the message because now the small box does not intersect with any windows. This is an annoying message because the window takes a while to draw, and even with clipping, I still have to calculate and draw the whole window (even though part shows).

Any suggestions? Has anyone experienced this before?

Thanks!

>Many thanks in advance

Possibly you should try to use the Diablo Emulator's capability to
print bitmaps? This is easier and certainly "cleaner" than accessing
the DMA hardware directly - this way, your programs will even work
with the "Heatseeker" (a gagdet that allows you to use SLM laser
printers with the Falcon030 - the Heatseeker comes with a modified
Diablo630 emulator).

You may be better off with something like LaTeX for a technical manual.

Calamus has excellent support for graphics, column layout, etc., etc.,
but for many simple, verbose applications, LaTeX is easier.

I find Calamus a great product. The display is very fast as it cleverly
caches bitmaps. And with the dozens of .CFN fonts from the GEMini CD-ROM,
it's even prettier!

1157. First TT problem - ICD link

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-01 04:37:23 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLyy6C.FEo@watserv2.uwaterloo.ca>
Source record: 34190
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well after setting up my new old TT (TOS 3.01) and switching the internal
48 meg drive with a 105, things seem OK EXCEPT:

The TT refuses to read BIG files from any ASCI device with the ICD LINK
connected. The driver I use is ICD PRO 6.0.2. The hard drive light(s)
(there are two external drives) just blink when trying to read a big file.
This happened when the 105 was external too, but the same files are OK now
its internal. Bizarre!

One obvious (and cheap) solution I suppose could be to use TT SCSI for every-
thing. Which brings me to my question:
Since the SCSI external cable I have which hooks up to the link had a female
centronics connector and the TT SCSI connector has a female(?) DB50 connector
does that mean I can eliminate the LINK with simply a PRINTER cable?
That would be pretty neat!

Other than that, I'm having a blast with the TT - a truly wonderful machine!

Normally, when updating a window due to a redraw message, one is required to
get the rectangle list, then calculate the intersection with the area to be
redrawn, then intersect that with the screen area (yes, the AES dont do that),
and then draw the window contents in this intersection area. So: if there
is no window over that spot, that should not take too much cpu time....
But nevertheless, this seems to be really wierd!

Regards,
Ulrich

1159. Help: Connecting Mega ST2 to NEC 3D (instead of SM124)

Hi there,
I've got a question that's probably been answered a thousand times, but I
am new in the Atari world (got an old Mega ST2 for free). The problem is:
the monitor (SM124) is worn out, not enough brightness anymore. Since I have
got a NEC 3D which isn't used for the moment I would like to connect it to
the ST instead, using it in high res as well as in medium res mode. Which
pins do I have to use?

Any help is appreciated. Thanks in advance,
Jan

I got the Blowup030 demo, and was pretty well impressed by it, but it didn't
do anything when MiNT/multiTOS was active. I.e., I got the same old 640x480
screen (that I otherwise haven't seen for *months*!). Screenblaster doesn't
give me as flexible a way to select resolutions, but at least it still
performs while MultiTOS is active. Presumably the real version of the BlowUp030
doesn't have this limitation?

[Just another guy with a 1990-era multiscan monitor, 15-36khz. Right now I
use 1024x560x16,60hz with Screenblaster. The 1280x960i mode was cute, but
almost impossible to work in on a 14" screen. The monitor itself was
originally rated at 800x600 noninterlaced, 1024x768 interlaced, but for
whatever reason Screenblaster doesn't offer these resolutions for me to
choose. sigh...]

Lharc's underlined objects don't draw properly on my system; the
"underlines" are actually through the middle of the character.

IMHO, this is one of THE ugliest "featuers" of MS Windows, OS/2, and
Motif... bleh.

Message-ID: <CLzMKu.1FL@watserv2.uwaterloo.ca>
Source record: 34095
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ooops, one mistake in my original post about this - I am using ICD PRO 6.2.0 NOT 6.0.2. As well, the problem doesn't occur when GENEVA is running, so it seems that the computer is trying to access too fast with just the regular desktop (or just Neodesk). Anyone else have a similar problem? I can't use TT SCSI exclusively because Spectre doesn't support TT SCSI yet, (maybe when 3.1 comes out!)

Thanks again,
Sam

1163. Microkernels?

Don,
I agree with everything that you "countered" with in your very complete
reply, except the above statement. If I may paraphrase (as best I can
remember) Michael Slater, author of The Microprocessor Report (who I had
the pleasure (?) of listening to for nearly 5 hours last week), who said:
The "reduced" part of the RISC acronymn is referring to how much processing
is done by each instruction - not to how many instructions are in the
programmer's model. (But what do I know? - I'm a hardware jock!)

> But seriously, why bother with the corrupt past at all? Why not make
> a clean break and the same type of leap as when the 68000 was introduced?
> Why anchor yourself (Moto, I mean) to R6000 (a niche market at best) in the
> first place?

Because, unfortunately, technology is once again driven by "business reasons".

I agree completely with your assesment of the current lack of knowledge
about the realities of the PowerPC chips. As a matter of fact, I *USED* to
read the comp.sys.powerpc USENET group, but there is more misinformation
and emotion found there than facts.

What the hell, let 'em think what they want.... It's probably good for
business (and the price of Moto's stock)!

Stuart Denman (sdenman@wolf.cs.washington.edu) wrote:
: I've written a GEM program that has 3 windows open. One has a resource tree
: that I draw in it and the others have VDI lines and text in them. The problem
: is that I get these weird messages from the AES telling me to redraw a small
: box (about 10 characters across and 2 lines high, right under the menu bar)
: after topping one window, drawing it,
: and topping the window I was in before. (This is when I click on
: a different window). There are no windows around this spot, nor have I called
: form_dial() over that spot to tell the AES to update it. I just seem to get
: this weird message. This happens weather I'm running on a Falcon, TT, or STE.
: Also, if I move the window to the right, it doesn't send the message because
: now the small box does not intersect with any windows. This is an annoying
: message because the window takes a while to draw, and even with clipping, I
: still have to calculate and draw the whole window (even though part shows).

: Any suggestions? Has anyone experienced this before?

: Thanks!

This really sounds strange. But first, let me get one thing straight:
do you get a redraw-message for the desktop or for a window? I thought the
AES didn't send redraws for the desktop to applications (only when they
contain USERDEF objects and from your description I conlude that this isn't
the case), so this would really be weird. Therefore I think I
misunderstand you, and you get a redraw for a window in which you draw
your own menu-bar. Please de-mystify me and I'll try to think of some
usefull suggestions. I have some, but I need the above information first.
You can E-mail me or reply by post, whichever is the most convenient.

hoping to be able to help, I greet you,

There is no upgrade to Flash 1.6, this was writen by Alan Page, he has brought out a New Program called THE STORM, this is PD/Shareware and is on A.A...

A OZZ firm took over the rights to the FLASH name and have come out with Flash 2, a bit of a look alike to Flash 1.6, but does not support the New Zmodem used here on this VAX site...

THE STORM does support this New Zmodem.....

TITLE: Re: Linux on ST

> I've heard that Linux was originally compiled to work on Intel
> processors only. Does anyone know if Linux has been or could be re-compiled
> to work on the Atari?

The port for Linux to 680x0's is being worked on as we speak,
however it will only be available for 030's and above becuase
of the lack of an MMU in the lower 68K series. Hence it is
baised towards TT's and Falcons. The main effort is in the
Amiga direction but with sidelines for Ataris and Macs. The
Amiga port is coming along very well, unfortuantely the lack
of Mac/Atari developers means that these ports are somewhat
lacking.

There is a 680X0 mailing list that you can join to find out
how things are going. 99% of the posts are aimed at the Amiga
port though.

It would appear that a number of monitors that are being sold as SVGA are
actually multisyncs. I bought a Samsung monitor as an SVGA for 180 GBP.
The name of it (SyncMaster 3) suggested that it might actually sync to
a range of H and V rates, and a telephone conversation with Karl Brandt
(Systems Solutions) suggested the same thing (I was trying to get
BlowUp Hard 2, and he said that BlowUp Hard 1 was likely to be enough).

So I rang Samsung to get the specs, and sure enough it can handle
Vertical refresh rates of something like (I don't have the exact figures
on my desk now) of 35 to 90 Hz and a Horizontal scan rate of 33 to 87 KHz.
I got good resolutions out of the demo Blow Up Soft, but they were too
flickery (and the demo works in 16 colours only), so looks like BlowUp
Hard 1 will be a good investment.

```
Hi everybody

Memory management errors are notoriously hard to find.
That's why I have decided to make MEMDEBUG publicly available.

Feel free to contact me if you have any questions

rEnE

Here is the README file:
------------------------------------------------------------

MEMDEBUG version 1.5

Author: Rene Schmit
Email : rene.schmit@crpht.lu

**************************************************************************

Copyright (C) 1992-1994
Centre de Recherche Public Henri Tudor
6, rue Coudenhove-Kalergi
L1359 Luxembourg-Kirchberg

This software may be copied, distributed, ported and modified in source or
object format as long as :

1) No distribution for commercial purposes is made.
2) No third-party copyrights (such as runtime licenses) are involved
3) This copyright notice is not removed or changed.

No responsibility is assumed for any damages that may result
from any defect in this software.

**************************************************************************

Package Description:

FEATURES:
---------
MEMDEBUG is a free utility for C programmers that provides,
among others, the following features:

* Memory management error detection:
Memory leaks
free()'s of unallocated memory blocks
...
```

```
* Memory usage error detection
Accesses to previously free()'ed memory
Off-by-one errors in memory blocks
...

* Memory usage profiling
All kind of memory usage statistics
Trace of memory function calls
...

* Error simulation
Low memory simulation
...

USAGE:
------
Using MEMDEBUG is very simple:

Compile the package once.

Add the following line to each of your sources:
#include "memdebug.h"

Recompile and link your program.

MEMDEBUG is activated by defining the MEMDEBUG
pre-processor symbol at compilation time

PLATFORMS:
----------
MEMDEBUG is written in ANSI C and should be completely portable.
It has been tested on the following platforms: ((?) == as far as I know)

MACINTOSH MPW C
GNU C
Think/Symantec C

PC Borland C
Microsoft C 7

HP Workstations (both 680x0 and RISC stations)
HP C
GNU C

DEC VAXC (feature subset, as VAXC not an ANSI
compiler)
GNU C (?)

SUN Sparc GNU C

Indigo GNU C

Atari TT GNU C

DISTRIBUTION:
-------------
```

The distribution kit contains all necessary sources and
documentation (PostScript file). NO object files are provided.

There is a simple test program. BEWARE: this program might crash
on your machine, as it does some really nasty stuff. Use it primarily
to check which features are supported on your machine! (comment out
source until it doesn't crash any longer).

A sample makefile for UNIX users is included (provided by
Wilfred Mollenvanger and John Borst)

memalpha.c
memalpha.h
memdebug.c
memdebug.h
memfree.c
memfree.h
memtypes.i
test.c
README
Quickstarter_Guide.txt
Memdebug.ps
makefile

MEMDEBUG is free! It is available by ftp on the following server:

```
+-----------------------------------------------+
| ftp.crpht.lu in directory /pub/sources/memdebug |
+-----------------------------------------------+
```

This server is brand new, so there might still be some
problems, and the directory structure might change in the near
future.

People in the US might also try:

ftp.netcom.com in directory /pub/gurgle/memdebug

Feel free to make MEMDEBUG available on other ftp sites!

Support:

There exist two mailing lists related to MEMDEBUG. For more
information, send an email to

majordomo@ftp.crpht.lu

with the following body

help
info memdebug
info memdebug-announce
end

You may also contact me by email if you
* have any problems
* detect any bugs
* have suggestions for improvements
* ported MEMDEBUG to a platform or compiler not mentionned above

And above all, email me if you

* like :-) (or dislike :-( ) MEMDEBUG

1182. Problem with GDB & SYM-LD

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-02 15:27:18 UTC
From: cs90cpr@brunel.ac.uk
Message-ID: <CM1MxJ.GIz@brunel.ac.uk>
Source record: 34115

Hiya,

I'm trying to use gdb (2.6pl18) with the symbol-file output from
sym-ld (pl36), but gdb won't load in my symbol-file complaining about
ranges, and suggesting it gets invoked with '-mshort'. Problem is I
didn't compile with -mshort, and besides that doesn't work anyway...
Any one had success with this at all?

And also, why does xstrip looks for a file '/tmp/ST0000.....' and then
not strip my executable?

Thanks for any help,
Charlie...

|> Other than that, I'm having a blast with the TT - a truly wonderful machine!
|>
|> Sam

Well at least some one else is as out of date on ICDs Pro software as I am :)

But seriously were you using AHDI to boot the internal SCSI drive, and
ICD to handle the external drive? Basically did the system hang when you
were trying to copy the files to the drive on the SCSI bus?

A test would be to try and read one of those "big" files into a text editor
and write it out. If the system does not hang in this case but does hang when
copying the file then trash either the AHDI software or the ICD Pro software.

AHDI/HDX makes a rather rash assumption that it will be the only ACSI/SCSI
driver software. When this happened to me with ICD sw controlling an ADSCSI+
on the ACSI and AHDI controlling the HD on the SCSI I tossed AHDI and have
been happy ever since. I later moved all my drives to the TT SCSI port and
purchased ICDs Pro software.

Brian

Don't try the 'speaker-type' bipolar electrolytic capacitors - most of those
will blow again after a short time, due to the high high frequency/high
current to which it is exposed. A film 2.2uF capacitor (MKP/MKT or similar) is
the best thing to use, and is not much more expensive.

1191. Mega STE pinouts for HD connector ....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-03 04:18:23 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2l3oef$1kv@news.dmpe.CSIRO.AU>
Source record: 34124

Hi Everyone ...

A friend of mine has a Mega STE and he is replacing the Hard Drive. Along with the drive, he wants to replace the internal SCSI adaptor with an ICD link or something. Now the ICD part is no problem, he just needs to know what the pin-outs are on the MOTHER BOARD so he can wire up an appropriate cable.

Many thanks,

Karl.

The CS-TEX HP Laserjet driver works fine for my DeskJet. Even
landscape printing; and it's reasonably fast. Don't know about WP,
but who wants to use that if you know TeX?! Especially since the
latest Atari version is 4.2 (correct?)

I would not have thought this was worth it nowadays. In the UK, mice only cost around 15 pounds. Actually, I doubt it can be done, and I suspect when it is done the other way, ST users just plug a PC mouse into their serial port, and run software to drive it for the ST. This can be done with 'Mouse Tricks' (commercial) I believe. Also I think PC speed comes with a utility to allow you to do this.

Your gdb version is outdated, I have gdb 3.6 pl4 here, and never
had any problem with its loading and recognizing of symbol files.
The gdb 3.6 port (by Andreas Schwab) is available from
ftp.germany.eu.net, and also from the standard atari ftp
archives, I think.
A year ago or so, another port was done by Joerg Hessdoerfer, but
this one is outdated, and the port has never gotten that far
anyway. If you have the Hessdoerfer port, you should get the one
done by Andreas Schwab.

|> Are there any programs for using multimedia CD-ROMs "for Mac and PC"?
|> If not, is this for any technical reason or just because nobody has
|> written anything?

It is just because nobody has written anything. The Falcon/TT is able to fully use a CD-rom on their "real" SCSI port. The ACSI port on standard ST's can only send 6-byte SCSI commands, so some of the more specialised SCSI commands that deal with CD-roms won't work. (Like Play Audio - it is to my knowledge impossible to write a CD-Audio player for a CD-rom connected to the ACSI port).

No, you have to set BLOWBOOT.PRG in the right position in the AUTO-folder. You
should have the sequence: (NVDI, if you have it :-)) (MINT) (SPDGDOS) (BLOWBOOT).
It can be checked by INDEX/unsorted in the desktop, BLOWBOOT.PRG has to be the
last. All other positions give very curious behavior :-)

1202. DMA Sound recording on the Falcon030

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-03 19:07:05 UTC
From: I.M.Rae-SE1@cs.bham.ac.uk
Message-ID: <2l5cgp$nrf@percy.cs.bham.ac.uk>
Source record: 34135

Can any person out there tell me how to go about recording sound to memory on my Falcon030. I have all the documents I can get (including the Atari ones) but I cannot get the sodding thing to record anything to a buffer in memory. So far as I can see I am doing everything I should be but nothing gets recorded to the buffer I specify in Setbuffer... very annoying !! I don't have my feeble source code attempts here but if anyone thinks they can help then I can always bring em in and email them.

Cheers

Source record: 34137

Feeling rather bored today I decided to reopen my upgraded Falcon
to have another look inside. Looking at my accelerator board I
was startled to find that the label on the CPU is 68030RC50

Does this mean that the processor is a 50MHz one?

If so would it be possible to increase the speed further by adding
a 50MHz clock and thus increase processor speeds almost 3 times?

I would be grateful of any ideas or of anybody actuallly being able
to do this, and if possible a solution of how to do this if it
is at all possible.

1206. How to connect ST to a monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-03 23:04:30 UTC
From: murdo@imperial.demon.co.uk
Message-ID: <CM42rI.46L@imperial.demon.co.uk>
Source record: 34139

I put this on c.s.a.st not so long ago, but now our news feed includes .tech
I'll try again here.
I have an ST and a monitor that I have tried to connect together. The monitor
is an old Phillips mono monitor, for a PC. I have the pinouts for it and
having built a connector I got a picture.
But it only took up about a quarter of the screen. (.5 or .6 ratio in each
dimension).
Can anyone suggest the problem. Have I used the wrong pinouts ? Or is the
signal not strong enough? Is there some gizmo that will do the signal
translation I need ? Do I need to poke around in the monitor ?
The monitor has a cable that ends in a 9 pin D connector, and I connect to this
with a cable from the ST.

My wife's sister needs WP for college and hasn't the money to buy one or I
wouldn't be attempting this.

Thanks for any help

Murdo

1207. Re: Differences 68000/68030 & 56000/56001

:>I'm doing some programming in C but has found that I need to
:>add some fast assembler-routines to my programs. I have done a little
:>68000 assembler programming and have a manual for the dsp 56000. My
:>question: are there any important differences between the 68000 and
:>68030 and the 56000 and 56001?

Fundamental differences :-

1. The DSP uses fixed point 24bit integer arithmetic whereas the 680x0 series
use 16/32 bit integer arithmetic.
2. The 680x0 has 8 data and 8 address registers , the DSP only has 4 48 bit
registers (X,Y,A,B well ok a,b are 56 bit).
3. The DSP does most things about 4-5 times faster :-).

Its a little much to try and explain all the important differences, I would
recommend that you read the Motorola 56001 programmers manual.

AFAIK the most recent version of CS-TeX is 5.2, which is distributed by
Maxon Computer (+49 6196 481814). It runs fine under TOS, MTOS and Mag!x.
You'll probably need at least 2 Meg for processing any serious document,
and you definitely need a harddisk.

The MegaST is fine, but the SLM is an Atari specific printer and cannot be
used with your PC. A better idea would be to get a LaserJet or a DeskJet.
This could be used with both machines, all you would need is a simple
switch box.

1214. METADOS 2.3 and the Gemini Atari CD-ROM

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-04 08:09:39 UTC
From: ralph@cerfacs.fr
Message-ID: <RALPH.94Mar4080939@hal.cerfacs.fr>
Source record: 33955
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,fr.comp.sys.atari

A friend lent me his Gemini Atari CD-ROM, so I tried it on my Mega 4 STfm running TOS 2.06, ICD Pro Boot 6.2.0, METADOS 2.3.

When I tried to double-click on a file on the root of the CD-ROM, it gave a alert box with something like "Unable to establish default directory." It worked with directories there, and viewing files in sub-directories. I am using ICD's old ICDROM.BOS v1.0 file since I do not want to use Mint (yet!). What gives?

When I tried to view the files there under gulam, I was able to, but gulam lost its file-name completion. Also, it took quite a while to load one of these files. I would see the CD-ROM light go on, then the computer seemed idle for 30 secs or more, and then a flurry of CD-ROM activity. Any ideas for all this?

P.S. Didn't see any new CD-ROM drivers on the CD though.

It's notz a problem of the command length, but command codes above 31 are
tricky (because ACSI uses the upper three bits for the device number). But
there are workarounds :-)

Jon,

Replacing a crystal in a system will not increase it's operating speed.
Take a Mega STe for instance. If you replace the 68000 with a 25MHz 68000
and put a larger crystal in there, you will completely throw off the timing
setup of the entire board.

The same is true on your Falcon. A system is tuned at before it is committed
to the layout package. In fact, before the schematic is complete, the system
is tuned and simulated looking at key timing signals to determine
trace lengths, widths, placement of capacitors, etc.

Your accelerator board could very well be running at 50MHz. Or more
likely, you could have a 25MHz crystal and a clock doubler feeding only
the processor. This is similiar to the way the OverDrive Processor
works. It's twice as fast on the inside as it is on the outside. It just
works asynchronously.

I would NOT recommend replacing the crystal.

Michael

Thanks Michael but the EAGLE 32 runs off the 32Mhz crystal in the Falcon that
is clock halved for the standard processor. What I wanted to know is if you
could add a 50MHz crystal to drive the Eagle board at 50Mhz. If all the other
chips onboard run at 16Mhz (which could be the case) just increasing the clock
speed of the processor may be possible. The only problem I see is if memory is
accessed at half speed of the processor. Seeing as the memory is 80ns I don't
think this is so as only a maximum of 12.5 million transfers can be made a
second to or from memory.

Please give any other comments as I would like to know if this changes things.

Jon Evans

1223. file conversion from Atari

1227. Stacy hard drives and SCSI

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-04 19:25:31 UTC
From: coutu@decvax.dec.com
Message-ID: <1994Mar4.192531.29324@decvax.dec.com>
Source record: 33960

The Stacy laptop contains a SCSI drive internally. Does anyone know the answers to the following questions related to the drive?

1. Are there limitations on drive speed? That is - can the drive interface handle today's faster drives? My old Supra interface cannot talk to a drive with a 10msec response time. Is this true of the Stacy interface too? I want to replace the old drive with a newer bigger one but would like to buy a drive which will actually work.

2. Can the internal SCSI interface handle daisy-chaining? Can it drive multiple disks that is. I could imagine it being useful to swap the cables around so that the internal SCSI is brought to the outside of the case. This way I could connect SCSI disks directly without buying another, possibly incompatible, ACSI to SCSI interface.

3. Has anyone tried using both the internal hard disk and an external hard disk? If this works then must both use the same drive controller software? I have a Supra 20Mb which works well. Can I use the Supra software to format and use a replacement internal drive? Or do I have to use AHDI?

Thanks for any and all help you can give!

Dan

1228. Re: Hardware scrolling on STE/Falcon.

From: wilsont@rahul.net
Message-ID: <CM5o4F.CBK@rahul.net>
Source record: 33961

In <CM598q.228@westminster.ac.uk> avsec@westminster.ac.uk (Philip Shore) writes:

>I believe that hardware scrolling for the STE is also on the Falcon030.

>I never found out how to do this - can anyone help me find out how to do it ?

Both machines have 3 registers that are important.

23 bit screen pointer, points at the starting WORD of the screen
Line width in words, This is different for the STE than the falcon beware
the STE is words-1 the falcon is word width.
4 bit horizontal register, tells the shifter what bit to start processing
on.

an example to illustrate the various directions.

4 320x200 16 color screen in a grid.
would be 320 bytes wide.
400 lines tall.

When you scroll vertically, simply add or subtract the virtual screen
width. -+320 from the screen pointer.

Horizontally:
stick the number: Xpos%16 into the horizontal scroll register, and
perform the following operation:

```
horzpos=xpos%16;
if (horzpos) setlinewidth( 159 );
else setlinewidth( 160 );
```

See, when the horizontal register is non zero, you must decrease the
line width by one word, because the shifter starts the operation early.

the '159' means 159 words wide...for this demo 2x2 area.
of course, '160' means 160 words wide.

Get the 'register list' that floats around on the net.

I bought a Naksha mouse some years ago for my ST. Now I know it came
with two adapter cables - one for the ST and one for the Amiga (I think).
As I recall, to use it on a PC, it should be plugged in without either
adaptor. This appears to me to mean a wee wiring change would be
required to make the standard ST mouse work with a PC, unless the
adaptor simply disables certain pins from the mouse.

>I've got a question that's probably been answered a thousand times, but
>I am new in the Atari world (got an old Mega ST2 for free). The problem
>is: the monitor (SM124) is worn out, not enough brightness anymore.

Why not readjust?

Steps (use plastic screwdriver for all adjustments, don't touch anything with
parts of your body, no warranties whatsoever):

- Clean the screen glass :-)
- Open the cabinet. Disconnect the speaker while opening.
- Locate the SUB-BRIGHT and FOCUS controls.
- Connect the open monitor to the ST. DANGER! HIGH VOLTAGE!
- Turn it on. Turn brightness and contrast controls to maximum.
- Turn SUB-BRIGHT until the beam becomes visible everywhere (diagonal white
lines will be visible all over the picture, left and right margins will be
slightly lit)
- Turn it back until these lines just disappear and the margins just are dark
again.
- Go back to "normal" brightness and contrast.
- If necessary, turn FOCUS to get better focus (surprise!)
- Turn the monitor off, disconnect and reassemble (don't forget the speaker
connector)

bye, Peter

In <21075108@MVB.SAIC.COM> Stephen Harold Goldstein wrote :

>I've seen numerous posts on how to convert a PC mouse to work with
>an ST, but never paid much attention. What I'd like to know now is
>the opposite possible as well - can an ST mouse be wired to work with
>a PC?
[...]

There is a really big problem: A PC mouse uses a internal serial interface
to send the mouse movement and button state (1200 bps, 8N1) to the PC.
So it is very simple to use a PC mouse for the ST - just plug it to the
serial port and use a driver software.

But a ST (or Amiga) mouse doesn't have such a interface - it sends seperate
signals for moving and button state. So you need a interface (and not
just some simple wiring !) to connect it to one of the COM-ports of
the PC.

... i recommend to use a PC mouse and not to try any connection ST->PC.

Ciao, Arno

Yes, R.O.M.-Software, Berlin, is shipping such a device.
It's called "Heatseeker" and it's priced at about 110 Dollars.

For more information, you'll have to call R.O.M. at +49 30 492 41 27
or send a FAX to +49 30 491 93 67.

Hi!

Here's one for the hardware oriented folks:

Did someone allready experiment with a TT and a Falcon
connected via SCSI?

Yes, I really two computers!

Thus building a 'SCSI-VLAN'? (a very local area network ;-)

I know that the are some caveats when using such a thing,
but before all that there is the problem, that the
SCSI id (of the TT) seems to be hardwired (to id 7)!

What is it with the Falcon?
The same one?
Is it hardwired or stored in NVRAM i.e. can it be modified?

Uwe

Karl> appropriate cable.

Well, the LINK is made to attach to the MSTE's external DMA port.
It's meant for use with external SCSI devices. ICD also makes an
internal HD adapter for the MSTE, I believe.

Why bother though? The internal HD adapter is just fine. Get ICD's
PRO utilities and you'll have just about all the advantages of the ICD
adapter without the cost... Then use the LINK to connect an external
SCSI device to the thing...

As for the pinouts, if you find 'em please post 'em. I'm curious,
too...

The STE hardware scrolling is present on the Falcon and is fully compatible.
It is done using hardware registers only as I don't believe the new Xbios
in the falcon supports it. It does work though - I have used it! :)

If it was that easy the manufacturer would have done it and charged
twice the price.

I have not seen one of these boards myself, but think memory speed
may be a limiting factor.

You could try progressively faster clocks to see how it performs.

1249. Mouse button release bug! ERRRGH!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-07 01:46:49 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar7.014649.7235@beaver.cs.washington.edu>
Source record: 33982

I'm doing some popup menus and I seem to have a problem getting the AES to wait for the mouse button to be released. This only occurs in MultiTOS, Geneva, and on my MEGASTE. Here's what I have (this is pseudo-code):

```
wind_update(BEG_MCNTRL);
wind_update(BEG_UPDATE);

loop {
exit=form_do()

if exit=POPUP_BUTTON
handle_popup();
} endloop

procedure handle_popup() {

repeat {
GET MOUSE COORDINATES AND BUTTON HERE WITH graf_mouse()
HANDLE DRAWING OF SELECTION, ETC.
} until mouse_button=1

evnt_button(1,3,0); * wait for button to be released

} end handle_popup
```

It seems to just fall through the evnt_button() even though the button is still held down. I even reserve the mouse control for my application, and this doesn't seem to work either. I've tried using vq_mouse to get the mouse button state, but they all seem to fall through so that form_do() thinks I've clicked on the dialog AGAIN!

Why does form_do() think I've pressed the button on it when my I havn't? Is there some internal variable that isn't cleared? Why does evnt_button fall through when the button is still down?

HELP! I've tried just about every combination of mouse button checkers that there could be. I've even tried several in succession! Once I tried vq_mouse() and it waited for me to lift up the button, but then when form_do() executed, it thought that the button was still pressed down!!!!!

ERRRRRRRRRRGGGGGGGGGGHHHHHHHHHHH!!!!!!!!!!

Any educated help would be appreciated.....

Well, there are a few aroud now. There is a Raytrace package that won't run
without a co-pro, There is a special version of POV that also uses it. There is
also a version of Ghostscript that needs one. I'm sure there are more.

|> {
|> // add two numbers - use 68000 code for the calculation
|> int sum;

|> [68000 code here]

```
asm ("addl %1,%0" : "=d" (sum) : "g" (a), "0" (b));
```

|> return sum;
|> }

|> Also, do I need any special switches on the command line ?

No.

See the GCC manual for more info about the extended asm statement.

i want to connect an internal 3 1/2" ide hd to my falcon, but i have
some problems:
- the seagate hd i want to fit in has 40 pins, and the old 2.1/2 had
44 pins: what shall i do with the remaining 4.
- it seems that tbhe 3.1/2" hd needs 12v voltage, the 2.1/2 needed only
5v. where shall i get the 12v i need? is the falcon's 12v suply
strong enough to give this 12v?

i think some of yo have done the transformation. i'd appreciate any
help...

nikopol.

About a 10x speedup for ray-tracing IF the ray-tracer's been compiled
with a library than can use the FPU.

So far, I have been unable to compile a working version of POV-Ray 2.2
on the Atari; I've tried gcc 2.5.8 and Lattice C 5.6. :-(

Message-ID: <1994Mar7.171014@cs.man.ac.uk>
Source record: 33992

Yes!

56001 is a DSP architecture and although the assembler format is grossly similar to 68000 the register and instruction sets are almost entirely different - too different to go into in detail.

>accessed at half speed of the processor. Seeing as the memory is 80ns I don't
>think this is so as only a maximum of 12.5 million transfers can be made a
>second to or from memory.

Right - now the meat & two veg. The major problem here would be memory access
timing. The RAM is on the main board clocked at 16MHz. Now, if we up the
clock of the CPU (off board), it won't interfere with the main board cycle,
but the CPU may well not wait long enough for memory transfer's.

This problem could be got round quite easily by modifying the DTACK generation
circuitry.

- the speed increase is not going to be drastic though as the CPU will still have to wait for the RAM, but it will speed up processing actual instructions, esp. small loops that can run from the CPU's Cache.

If the accellerator board has some way to fit on board fast ram then you are on to a winner, but the DTACK generation becomes slightly more complex as there will then be different access timing for the on board ram & the falcon main board RAM.

This can be got around though (witness the TT).

>Please give any other comments as I would like to know if this changes things.
>

For my money - I'd be willing to have a go at it myself once the guarantee has expired on my falcon.....

1263. Changing TRAP#13 vector (BIOS)? How?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-07 18:18:31 UTC
From: hjv@phil.ruu.nl
Message-ID: <2lfr5n$49b@chico.staf.phil.ruu.nl>
Source record: 33994

I have a program that writes it's output to the screen (not too uncommon, huh? :-). However, I want to call this program from within my own program, and capture it's output to file. In order to achieve that, I need to intercept the Bconout() function and direct it to a file instead of the screen (well, output should go to the screen too in fact, but that's a detail).
Now the problem is that I understand that I should change the TRAP #13 (Bios) vector, but haven't the faintest idea where to start. I'm quite an experienced GEM and C-programmer, but I've always avoided low-level stuff like interrupts, vectors, etc.
What I figured out is that I should do something like the following:

```
int main(void)
{
void (*oldvec)();

oldvec = Setexc(-1, NULL); /* BIOS 5: store the old vector */
Setexc(13, newvec); /* BIOS 5: install new routine */
/* rest of the program */
Setexc(13, oldvec); /* BIOS 5: restore old vector */
return 0;
}

void newvec( void )
{
/* find out which BIOS function is called */
/* if function = Bconout(), intercept it's parameters
and send the char to a file and call the normal Bconstat(),
so that output is sent to the screen too */
/* if function != Bconout(), just call the normal BIOS-routine */
}
```

Questions: is this approach allright in general? And if it is: how do I implement the newvec() function -- i.e. how do I find out which BIOS function is being called and what it's parameters are, and: how do I call the old BIOS routines once my newvec() installed itself? Or should I call the old dispatcher too at the end of my newvec() -- i.e. something like:

```
void newvec( void )
{
/* my own stuff -- see above */
oldvec();
}
```

And if the approach is wrong: how should I do this then? *Can* this be done in C, or is Assembly unavoidable?
All answers, reactions, etc appreciated. And Sample C-source prefered of

course :-).

Mucho thanks in advance -- reply either by email or in this group.

1264. Re: How do I put assembly code in GCC .C files ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-07 20:05:29 UTC
From: wilsont@rahul.net
Message-ID: <CMB956.L1x@rahul.net>
Source record: 33995

In <2leun4$leg@comfrey.csv.warwick.ac.uk> csulw@csv.warwick.ac.uk (Paul Donovan) asked the great question to the net.

>How do I put some 68000 code in my C source files to compile with Gcc?

>For example, how would I do the following function:
>int asm_add(int a, int b)
>{
> // add two numbers - use 68000 code for the calculation
> int sum;
> [68000 code here]
> return sum;
>}

And So I spoketh:

```
int asm_add(int a,inb b)
{
register int in1 __asm__("d0");
register int in2 __asm__("d1");

in1=a; /* grabs data off stack */
in2=b;

__asm__("
addl d0,d1 | do the addition

movel d1,_aglobal | just to show you how to access C globals

");

return(in2);
}
```

No special flags are needed on the command line.

Obviously, doing an add this way is very inefficient.

Some other points to remember is that its MIT syntax!

```
movew moveb movel
movew a0@,a1@+
addw d4,a7@-
mulsw a0@(6),d0
```

notice, no '.' and indirect adressing is done with a '@' not '()'

[much deleted...]
Just a thought, but there might be a much easier way to do what you want.
Try using Fdup() and Fforce() to redirect the standard console output to
another file's handle, just before you call the program. You can set it back
to normal after the program has returned. (I can't remember exactly how to
do this, but I do have some old sample code somewhere if you need it.)

Also, the program you want to run might have been compiled with a C compiler
that supports redirection in the startup stub. Try executing it as:

PROG.TTP >outfile.txt

and see if anything gets written.
Hope this helped,

>do this, but I do have some old sample code somewhere if you need it.)

Thanks for the tip, but... in this case this doesn't work. I erally meant waht I said: I need to intercept Bconout()... unfortunately. However, I think (but who am I?) that this can't be *that* hard... I hope...

>Also, the program you want to run might have been compiled with a C compiler
>that supports redirection in the startup stub. Try executing it as:

>PROG.TTP >outfile.txt

This might be an option... But then, if I start this program from within my own program with Pexec(), how do I do this redirection then??? I mean, I won't be calling it from a shell. Should I just try to put ">outfile.txt" as the first argument on the commandline that I pass with Pexec()? Sounds rather logical to me in fact... :-)

Thanks for thinking along,
Hendrik Jan

For Sale
Atari 520ST Personal Computer
2.5 MEG ram upgrade
(1) Double sided disk drive
(1) Single sided disk drive
(1) Mono monitor
Mouse
All the power supplies

Software: Flash, Degas Elite, Drafix, some other stuff.

Everything works except the computer has some problems with a loose
connection on the main board that I haven't gotten to work consistently.
If you're looking for extra equipment for your existing Atari setup this
might be a good deal.

All for $125.00.

I also have an 1200 external modem and a Panasonic KXP-1091 printer with the
system and would be willing to let go of them as part of the package for an
additional price we could agree on.

Call me: Doug at 543-7575 ext 322 wrk, 365-3824 home
or e-mail dougg@u.washington.edu

>I have a Portfolio with A serial adaptor, I would like to know of a fi
>transfer program to use, possibly from the Michigan archives.

You can not use the build-in file-transfer system on the Portfolio
with a serial interface, but with a paralell interface, a special
cable, a my special software for the ST/TT you can use it. And it's
really fast (much faster than Atari's software for IBM PC !!)

To use the serial port you need a comm-program for the Portfolio.
I have a demo version of a VT100 comm-prg made for the Portfolio.
Give me an adress and I'll send it to you (but you still need a way
to get it transferred to the Portfolio or to a memory-card...)

1269. Re: ST Mouse --> PC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-08 04:11:15 UTC
From: ktessner@isle.waterloo-rdp.on.ca
Message-ID: <1994Mar8.041115.99@isle.waterloo-rdp.on.ca>
Source record: 33999

Steve Taylor was heard to say:

> : the opposite possible as well - can an ST mouse be wired to work with
> : a PC?

> cost around 15 pounds. Actually, I doubt it can be done, and I suspect
> when it is done the other way, ST users just plug a PC mouse into their
> serial port, and run software to drive it for the ST. This can be done

The signals on a bus mouse (Microsoft Inport) are fully compatable with
the ST's mouse port. They can be used vice versa, but the pins must be
adapted:

----8<-------------

Atari ST Microsoft Mouse ST expected signal
----- -- --------- ----- -- -------- ------
1 5 XB
2 3 XA
3 8 YA
4 9 YB
5 N/C N/C
6 2 Left button
7 N/C +5VDC (N/C)
8* 6 and also tie to pin 1 Ground
9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
-------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 A |
| |
-------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
```

```
| 5 6 |
\ /
\------------/
```

```
------8<----------
```

Source unknown, but it does work just fine. The view above is the view into
the female connector, on the PC mouse's end of it is mirrored.

```

>Ofir ogal@cix.compulink.co.uk

I have that one Thanks...

The best one that I have seen is GEMfont 122, its the best that I have seen..

I have seen some Funny thing with Fonts, Flash 1.6 has a ANSI option and works good with VT100, but if I install NVDI it stuffs this font up, but if I have a look at the NVDI Fonts they are similar to built in system fonts..??

I know I can disable the NVDI system fonts but I am still puzzled why this is happening..

Can any one shed some light on this...

You should pass the ">outfile.txt" on the command-line with Pexec if it's the
compiler's code that does the redirecting.
There was a program in a STart (Dutch ST magazine) episode some three years ago
that does exactly what you want (redirect BIOS output).

1273. XV to PicSwitch (GIF)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-08 09:34:16 UTC
From: mcssesw@dct.ac.uk
Message-ID: <1994Mar8.093416.11077@dct.ac.uk>
Source record: 34004

I am trying to save a picture on my DECstation 3100 at college and use the graphics on my STe at home. I can save the required image on the DECstation using a package called XV under Unix. The image is GIF format, about 670 x 450 pixels in size. I came across a ST program called PicSwitch which claims it can load GIF graphics. When I try to do this though the computer crashes with three bombs. :-(

I have also tried using Paintshop Pro on the PC to load the GIF file. All I can get is a totally black image appearing. However, when I load the file back into XV it displays it as normal!?!

Does anyone have any ideas how I can perfect this cross-platform transfer? The GIF format that XV saves is 87a. I would like to load this into my ST in mono resolution and save the result as .PI3, .IMG, .PCX or .PIC.

Any help would be appreciated.

Karl there is no need to do this, just get ICD's Pro Software, then use Ataries
built in host adapter.....

What type of drive do you intend to use..???

The Link is just a large 19 to 50 way type plug, with some LSI IC's
inside, intended for external Drive boxes, like the ones use on a MAC....

In article <2lfr5n$49b@chico.staf.phil.ruu.nl>, hjv@phil.ruu.nl (Hendrik Jan Veenstra) writes:
[Wrongs ways to intercept BIOS deleted]

|> And if the approach is wrong: how should I do this then? *Can* this be done
|> in C, or is Assembly unavoidable?

Some assembly is required because
(a) when you steal the BIOS vector you have to deal will BIOS calls made from supervisor and user mode, and the SSP/USP are not accessible from C.
(b) when you exit you have to jump into the old handler or do a rte, not a rts which is what the C compiler generates.

The code below (which I wrote off the top of my head and is _completely_ _untested_!) attempts to do what you want. You store the old bios vector in 'oldvec' and replace it with 'new_bios'. Then when active != 0, each call to Bconout() will cause a call to a C routine 'new_Bconout()' with the same arguments just before the real Bconout() call takes place. You can safely call Bconout() from 'new_Bconout()' by setting active = 0. If you don't want to do the real Bconout call at all, put an rte instruction just before the 'skip2:' label.

Steven

ASM ==>

```
xdef _new_bios
xref _new_Bconout
xref _oldvec
xref _active

longframe equ $059E ; long stack frame flag

_new_bios:
tst.w _active ; are we active?
beq.s skip2 ; if not, skip
move.l usp,a0 ; get user mode stack pointer
btst #5,(sp) ; were we called from supervisor mode?
beq.s skip ; if not, skip
lea 6(sp),a0 ; get pointer to args on super stack
tst.w longframe ; CPU has long interrupt frame?
beq.s skip ; if not, skip
addq.w #2,a0 ; skip over format word
skip:
cmpi.w #3,(a0) ; check for Bconout()
bne.s skip2 ; if not, skip
move.l 2(a0),-(sp) ; copy args on to supervisor stack
```

```
jsr _new_Bconout ; call new_Bconout()
addq.w #4,sp ; correct supervisor stack
skip2:
move.l _oldvec,a0 ; get address of TOS bios handler
jmp (a0) ; jump into it
```

C ==>

```
long oldvec; /* save old bios vector here */
int active; /* flag to activate/deactivate Bconout() interception */

int new_Bconout(int dev, char c)
{
/* At this point we're in supervisor mode. We can call Bconout like this: */
active = 0;
Bconout(new_dev, c);
active = 1;
/* Must not call GEM at all. */
}
```

Hi!

After posting an article under this title, I received lots of hints, clues and sollutions... First of all I would like to thank everybody who E-mailed me, or who posted an answer on this newsgroup.

Second of all I would like to say that _I have my colour back!!!_
What was wrong, I dunno. But when I was trying to measure some voltage on a circuit, I somehow made a short circuit and my colour was back! As sudden and strange as it dissappeared, it came back.

I do not know what was wrong, when it came back after a short circuit, but the major thing is that it is back. Any clue about what happened would anyhow be appreciated because I do not know IF and/or WHEN it will come back...

I've exported XV's Gif to the ST using ViewGIF without too much
trouble (though it gets upset sometimes if you exceed the screen
resolution). Photochrome, Speed of Light and GemView all display these
GIF's OK and should be able to export them to something ST-native.

The "Heatseeker" certainly works with both Atari Lasers.
It replaces the big old SLMC-controller, which is no longer necessary.

1279. Help needed with interupt routines

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-08 13:29:13 UTC
From: cb170@city.ac.uk
Message-ID: <cb170.763133353@Fowey>
Source record: 34011

Can anybody out there in ST land help me with programming interupts?

I am writing a MIDI utility in GFA Basic 3.5, but instead of using
its own input routines I want to call assem routines to do it on an
interupt basis.

What the routine should do is check the MIDI port to see if there
is a byte there, if so take it in, maybe store it in a buffer and
pass it back to the main GFA program. This needs to be done every time
a byte enters, so that none are lost.

I have no idea how to write the assem routines - anyone got a good
knowledge of this sort of stuff?

Thanks,

>archives, I think.

Yeah! I could never get GDB to work for me at all. And then a few
weeks ago there was some discussion about GDB 3.6pl4 and I
downloaded that (can't remember now from which site) and it
still didn't work for me, so I got the sources as well,
recompiled it, and lo-and-behold it works, well almost,
it now complains about files compiled with -mshort, however I
don't normally do -mshort compilations so its Ok for me.

```

No wonder - don't mix up graf_mouse() and evnt_xxxx() calls. Use evnt_multi() with MU_BUTTON and MU_M1 / MU_M2 events to track mouse movement and clicks at the same time. Calling graf_mouse() will confuse subsequent evnt_button() calls.

> - Marco -
Hmmmm.... For being a user of the program in question, Flash II, which
is at v2.2, I am not total agreement with your statement. Yes, it is
an upgrade. Kind of a total revamp of the original.

The demo you speak of is very buggy, and known to be so, or from what I have
read, it is. I used it, and I did not notice them, but them I did not
'totally' test drive it before I bought it.

It has absolutely NO problems with file transfers, at least this is my
experience. What I think that they should do, is release a new demo,
so that people can see a demo minus the bugs.

Please, it's fine to slam software that you have 'driven', but with a
known buggy demo, don't start judging. Drive the real thing before
putting it down.

> buy a drive which will actually work.

I never heard about a case where an ACSI host adapter really refused to work
with a hard drive just because it was fast. There are two things that
can happen:

a) The drive has "unusual" timing characteristics (I'm *not* talking
about the general speed of transfer) which the host adapter cannot
handle.

b) The host adapter limits the transfer speed, so getting a fast drive
might not give you the improvement you've hoped for.

(a) is not too likely, (b) can happen, but only for drives with sustained
transfer rates exceeding 1.5 MB/s. Which drive do you intend to add?

> 2. Can the internal SCSI interface handle daisy-chaining? Can it drive
> multiple disks that is. I could imagine it being useful to swap the cables
> around so that the internal SCSI is brought to the outside of the case.
> This way I could connect SCSI disks directly without buying another, possibly
> incompatible, ACSI to SCSI interface.

I've never owned a STacy, but I assume that it has an external ACSI
port, so connecting a second ACSI drive should be easy. I doubt that
the internal host adapter can handle more than one SCSI drive, though.

> 3. Has anyone tried using both the internal hard disk and an external hard
> disk? If this works then must both use the same drive controller software?
> I have a Supra 20Mb which works well. Can I use the Supra software to
> format and use a replacement internal drive? Or do I have to use AHDI?

Yes and no. The internal STacy drive is a Conner drive with a few
annoying controller bugs. Software which counts on a working controller
might break. I'm especially talking about the bug in the Conner controller
which makes it hang when asking it about information for LUN 1.
Some third-party software does that, and you might have to configure
the software to ignore LUN 1. Other than that, I don't see restrictions
in the driver software.

Yeah, sure -- that's what I meant...

>There was a program in a STart (Dutch ST magazine) episode some three years ago
>that does exactly what you want (redirect BIOS output).

Hmmm, this might be an alternative in case all the other variations don't work,
but in principle I'd like to do it without an extra program. Thanks for the
hint -- probably such a program will be available somewhere on a BBS or
whatever... I'll take a look for it.

And in the menatime: if anyone has anything to say about changing TRAP#13...
you're welcome :-).

Thanks again,

I run a program called SLAVE on the Portfolio when I'm
doing file transfers. You will need something like XTERM2 to
get SLAVE on the Portfolio in the first place though.

SLAVE allows control of the Port from the ST (or any other
host). X-Modem and ascii transfers are supported as well as basic
DOS commands such as MKDIR, DIR, CD, DEL. Everthing is much easier
when you only have to type on the STs keyboard.

I downloaded my copy of SLAVE from GEnie in the Portfolio
RT (page 950) library but it is probably available on umich.

On the ST end I use STalker, a commercial program. I'm not
sure what com programs are available on umich for the ST.

:with all other programs that support the clipboard.

Try using setting the env. variable SCRAPDIR instead (or as well as) CLIPBOARD
I've seen programs that use this; in fact I think that SCRAPDIR is the
correct one to use.
An alternative is to use the Atari Clipboard CPX, which I presume does a
scrap_write() to set the clipboard directory at bootup.

Incidently, does anyone know for sure whether CLIPBOARD or SCRAPDIR should
be used? What do the Atari developer docs say? I think the Compendium says
SCRAPDIR.

Ever since I released VOX-Mail last week, I have been getting questions
on compatibility of VOX-Mail on UK/Europe phone lines.

AFAIK, there should not be much differences between US and UK phone
lines except the guard tone which doesn't matter to VOX-Mail. What I
like to find out is whether phone companies in UK send a line reversal
signal when a caller hangs up. Anyone knows anything about this??

And also, are phone lines across Europe pretty much the same as those in UK??

Thanks!

Ta Ta For Now,
Michael Fung

The most important thing to remember, performance-wise, is that a DSP is like an ultra-specialized FPU. Generally, DSPs are designed to execute one type of instruction - a multiply and accumulate (MultAcc) very quickly (among other things). Compare the # of cycles it takes on a DSP with the number it takes on an FPU or a standard CPU

Marco_Fris@nextjk.textlitho.nl writes:

>There is no real upgrade. The publisher (Antic) went out of business.

Antic did go out of business, but Missionware bought the rights to the
name Flash from them. The program has a similar look and feel to the
Antic one but it is a complete rewrite since the author of Flash 2 is
not the same as Flash 1. They also offer an upgrade from any 1.x
version of Flash for $30US and _free_ upgrades from any 2.x version.
Current version is 2.2 with 2.3 (MultiTOS compatible) in process.

>seen a demo of a program called Flash 2.x, but that's a new program, you
>could hardly call it an upgrade. The demo looked nice, but it wasn't quite
>finished. Problems with filetransfers e. g.

I've been using v2.1 for a while (need to upgrade to v2.2 soon) and
have not had any file transfer problems. Support is very good too,
you can contact Missionware from Internet on their Compuserve, GEnie,
or BIX account.

>I said: I need to intercept Bconout()... unfortunately.

Perhaps you should try MiNT - under MiNT, a program can _easily_ redirect
BIOS *and* GEMDOS handles into a file (using the standard GEMDOS function
Fforce()).

> However, I think (but
>who am I?) that this can't be *that* hard... I hope...

Yes it is - there is one _really_ serious problem:
you must *never* call a GEMDOS function from within a BIOS function.
GEMDOS calls BIOS for doing all I/O, and if BIOS in turn calls GEMDOS,
you'll get a nice system crash... (since GEMDOS is not reentrant)

>>Also, the program you want to run might have been compiled with a C compiler
>>that supports redirection in the startup stub. Try executing it as:
>
>>PROG.TTP >outfile.txt
>
>This might be an option... But then, if I start this program from within my
>own program with Pexec(), how do I do this redirection then???

Like this:

```
Fforce(1, outfile) ; /* redirect STDOUT */
Pexec(....) ; /* child process will *inherit* redirected handles */
Fclose(1) ; /* IMPORTANT because of GEMDOS bug */
Fforce(1, -1) ; /* restore output to screen */
/* outfile may or may not be usable at this point - I don't know... */
Fclose(outfile) ;
```

Note: if you omit the Fclose(1), GEMDOS will "lose" a file handle - this
is a GEMDOS bug that's present in TOS versions 1.04 (1.4) through 3.06
(and possibly in newer versions, too; MiNT doesn't have this bug, but
the additional Fclose doesn't hurt, either).

(Note that TOS 1.0 and 1.02 have even worse bugs in this area...)

>I mean, I won't
>be calling it from a shell. Should I just try to put ">outfile.txt" as the
>first argument on the commandline that I pass with Pexec()? Sounds rather
>logical to me in fact... :-)

This will only work if the called program's runtime startup code parses
the command line and does the I/O redirection itself; that depends of
course on the language and the library used...

Well, RSVE is available in German at ftp.uni-erlangen.de, but I have had no luck finding ST_ESCC. This sounds quite interesting as it seems to add the modem ports available on the later ST models with high speeds. Any ideas on locating the docs? Do you have them?

Source record: 34031

Hello all... I am trying to fix a 520ST, (original '85 vintage) that has a wonderfully interesting problem.... The DMA port... The system will read and write to a floppy happily, and will read from a hard drive happily.. But, when you try to write to the HD, (with write verify turned on), it errors out until it gives up.... Before you all tell me the hard drive is bummed, it was checked out with another ST, which worked wonderfully.. So, it has to be the DMA port on the 520... I've replaced the DMA chip, the GLUE and the MMU, all to no avail... Same problem all the time...

What I want to know is - has anyone else had this problem? Do they remember what they did to fix it? (Besides the hammer idea... I've suggested it, the owner didn't like it.... :-))

Thanx in advance to anyone with any info!! Post here, or email me at drichard@isle.waterloo-rdp.on.ca

1300. Re: How to change video of F030 from PAL to NTSC?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-10 08:56:35 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <1994Mar10.085635@cs.man.ac.uk>
Source record: 34033

If you use the O/S call setscreen (opcode 5 XBIOS) the Falcon processes the supplied resolution information to eliminate illegal screen codes (well most illegal modecodes anyway): e.g. if you set the VGA bit and you are using a colour monitor, it will just flip the status of the horizontal bit (because this has the effective 'opposite' meaning in VGA to colour monitors). It also masks out the sync mode bit, so it maintains the current refresh rate.

If, however, you use the Falcon XBIOS call err Vsetmode I think (opcode 88) this does not have any processing attached, and so you can happily tell the machine to change sync rates. Note that programs that use this will be less portable, because they will only work on a particular type of monitor. This point is not made at all in the Atari documentation - at least not that which I have!

Or if you jsut want the Falcon to go into 60Hz on boot and stay there, use something to alter the default configuration in the CMOS RAM, which contains a bit to mark the boot resolution and sync mode. Lots of PD programs do this.

Hope this helps

Dave

|> him. he was asking about the difference bewteen at 68000 and a 68030 and the
|> diference between a 56000 and a 56001

OK. There are a huge number of diffs between the 68000 and the 68030. The main improvements are: 32bit ALU, MMU, bitfield instructions, data and program caches, huge number of extra addressing modes, extended interrupt stack frames, extra registers to support virtual memory, 32bit address & data busses, better pipelining, address register scaling, barrel shifter, word alignment restrictions lifted.

The main gotchas when treating a 68030 as a 68000 is that move sr,Dn is now a priviledged instruction and if you want to fake an interrupt stack frame (typicaly to get control of the CPU _after_ a system interrupt handler has done it's stuff) you need to push an extra zero word (the frame format) on the stack.

AFAIK the 56000 is the bespoke part with the on-board ROMs loaded with the clients data whereas the 56001 is the off-the-peg part with the ROMs loaded with stuff Moto thought useful.

1307. How do I set up BGM Partitions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-10 15:46:37 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-100394154637@ngalm099.gal.nt.com>
Source record: 34040

I have a four meg STFM, with a Supra host adapter. I want to start using partitions larger than 32 Mbytes. The supra documentation does not help, so I got a copy of AHDX from a.a. When I format a drive to greater than 32 Mbytes, I cannot access it (using TOS 1.04).

I know that it is possible to edit the drive partition information to change the byte per sector to 1024,2048, even up to 8192. This may only work for drives that are less than 64 mbytes. I have a 245 Mbyte drive, how can I partition it to four 64 Mbyte partitions.?

Please reply by E-mail as I no longer get a full feed for the Atari groups (every other one, yes, C.S.A.ST & C.S.A.ST.Tech , no). My Sys Admin can't find out what's wrong, I get less than 1 post/day.

Thanks in advance

|> interupt basis.

Why is this? Do you want interrupts for reliablity or to run MIDI processing
in the background?

|>
|> What the routine should do is check the MIDI port to see if there
|> is a byte there, if so take it in, maybe store it in a buffer and
|> pass it back to the main GFA program. This needs to be done every time
|> a byte enters, so that none are lost.

For 100% reliable MIDI it is not sufficient just to have your own
interrupt routine. Various bits of TOS disable interrupts too long and
cause overruns on the ACIA.

|> I have no idea how to write the assem routines - anyone got a good
|> knowledge of this sort of stuff?

Even if you don't want 100% reliable MIDI, writing your own handler is
nontrivial because the interrupt is shared with the IKBD and your routine
must service both devices to avoid lockup :-(

A couple of years ago when I wrote a sequencer I thought I had found a neat
(but extremely complicated) solution by making non-interruptable parts
of TOS interruptable and avoiding non-reentrancy problems by delicate
manipulations of the MFP mask registers... Unfortunately people have told
me that the sequencer bombs with early TOS versions so there is still
a race condition that I haven't pinned down.

I am working on a better solution but don't hold your breath. Probably
the best solution is to upgrade to a faster processor (Incidently this
is the _only_ solution in the PC/Windoze MIDI arena...).

I've got it, lost the disk though... I don't even open it anymore,
I haven't opened it in about 4 years. You can have it :)

If you are serious about learning 3D routines get the book COMPUTER
GRAPHICS by Foley, Van DAM et al. This is book gives a very serious
treatment of 2D and 3D, and includes lots of pseudo code for the
various routines it describes.

I'll send you the book if you really want it, just mail me your address.
But Foley's book is what you really need.

Brian

I have never seen a 3 1/2" SCSI hard drive, so I have no idea what the pin configuration is. Is it 40 pin? Does it have the same 5 volt, 12 volt, and ground power connectors that 5 1/2" drives have?
I have a couple perfectly good hard drive cases, but they are for 5 1/2" SCSI drives and I can't seem to find a new drive that holds less than a gig. I'm sure I can find a way to mount the 3 1/2" drive in the case, but how would I connect it to a 50 pin centronics scsi connector? Is there an easy to find cable?

That's what I meant. It's more than an upgrade: it's a rewrite. Nothing negative implied here. At the same time it's less than an upgrade: as a registered Flash 1.6 user I've never seen an upgrade offer.

JH> It has absolutely NO problems with file transfers, at least this is
JH> my experience. What I think that they should do, is release a new
JH> demo, so that people can see a demo minus the bugs.

Right. I would be very interested in a better demo, as I liked some of the features I saw very much.

I didn't mean to slam anything, just reported what I saw: a demo that wasn't quite finished. That doesn't have to mean anything for the real thing, but at the time it wasn't good enough for me to contemplate dropping good ol' 1.6.

>in the background?

Reliability. GFA can manage a bulk sys.ex. dump with bit of clever
coding (took me a while to figure this one out!), but it only just
manages - ie if you have desk acc's installed it slows down the
program's speed as there is more going on in the event_multi loop.
As a result, some bytes get lost, hence corrupting the data.

ok. IGot my RAMGizmo today. I installed the SIMMS and the board (I swear its off a hair...).

On turning the machine on, nothing but black. So I plug the old atari 4meg baord in, works fine. I check everything, still black. I then use four 1meg SIMMS I have, machine worked just fine...

The 4meg SIMMS are 80ns. The Jumper setting on teh RAMGizmo is correct. All should work...

I then tested the 4meg SIMMS in a IBM/PC Clone, worked fine...

Physically the 4meg simms are smaller then the 1meg ones, about 1/3 smaller. just three chips on them, whereas the 1meg SIMMS the whole board has chips on them...

Any help or comments are appreciated...
thanx

gcc is always a (mostly) ansi-compiler, "-ansi" brings it into a mode that
rejects all extensions of gcc relative to ansi, so you can check
that your code only uses ansi compliant techniques. Without
this switch, I think that only the trigraphs are missing.

If you want to compile K&R sources, you sometime even have to
use the "-traditional" flag.

>Is it hardwired or stored in NVRAM i.e. can it be modified?

I had a setup like this on my old Mega ST4 and 4160 STe, both using ICD host adapters. It worked because both machines could see any data that went over the ACSI bus. (So when one ST read the disk, the other could fill its disk caches simultaneously. Likewise, when one ST wrote to disk, the other would update its caches for any affected blocks.) I had tried again with my Falcon and the other two STs, but it wasn't too happy. For some reason the bus got hung if the Falcon was present; I guess the SCSI-2 i/f on the Falcon was different enough from the ICDs that they couldn't talk any more. I never spent any time investigating, had too much else to do.

My guess is, since the TT is also SCSI-1, it will also be incompatible with the Falcon. I haven't tried to hook up a TT to the STs yet. It might work again through the ACSI port. Who knows...

Bus arbitration gets difficult. ACSI doesn't provide for multiple bus masters. I wound up using the MIDI as a token-passing-ring to insure the integrity of the ACSI bus. This was also how I passed source and target addresses back and forth when doing ST to ST (memory to memory) communication.

For pure speed, this setup can't be beat. I was sharing a Quantum hard drive and a Syquest between the two STs. But, due to various other projects, my Mega eventually bit the dust, and I haven't been able to run this way since. (Actually, it seems all that's wrong with the Mega is a loose ROM and loose power connections; the result of my shoddy installation job putting it into a tower case. But since I no longer need to use it anyway, it sits idle...)

>
>Thanks!

Would be nice if they were all the same, but no. Maybe in a few years as the
ESA becomes more of a reality. As it is, each country has pretty different
sets of specs and safety requirements, etc... Some countries seem to be
satisfied if equipment meets British standards, others are more particular.
While the DTMF frequencies used to dial calls are in a CCITT standard, the
call progress signals (ring, dialtone, busy, reorder, etc.) are not. To top
it off, most of Europe is still using pulse-dialing, not DTMF touch tones.

As for the line-reversal signal - you can't even rely on it everywhere in
the United States - whether it will arrive at all, how long a delay between
hangup and signal arrival, etc... Europe is worse.

I've been all up and down this road before. It's a pain. But it's not entirely
insurmountable. Just tedious...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi ho.

I've just installed an exabyte exb-8200 video-8 streamer on my Falcon.
So, I tried to get it working with gemar.
But no :-(

I got it to load/unload tapes, but when the program tried to write to the
tape, it just hang around - nothing happening for a while. Then it would abort with
an illegal instruction error, or address error, or even worse. And the scsi-bus would
hang with an active busy-signal.
(Luckily I had a program on the IDE drive to reset the SCSI bus).

So, in short, has anyone gotten an exabyte exb-8200 to work with gemar.
OR, has anyone else experienced similar results while trying to adapt a .par file
in gemar - and fixed it.

Erling

Hello,

I have the following problem with a SLIP connection.

From my ST at home I'm using ka9q to connect to a modem at the University.
From there I use telnet to login at a UNIX workstation.
Only from this workstation I can reach the world.

I would like to use a client programm on my ST.
(stigc a client for the International Go Server)

The problem is after I did the connection to the UNIX machine
I have to leave ka9q to start the client program on my ST.
But then of course the SLIP connection is gone.

Any ideas to solve this problem?

Joachim

You should try DVI 2.10 which works with or without MiNT and
prints to almost every printer around. There is a special
Stylus driver available and I think it is even able to print
landscape.

You should use the following mode_def:

```
%
% local.mf
%

proofing:=0; % no, we're not making proofs
fontmaking:=1; % yes, we are making a font
tracingtitles:=0; % no, don't show titles in the log
pixels_per_inch:=360;
blacker:=0.5; % make the pens a little blacker
fillin:=0.2; % and compensate for fillin
o_correction:=.2; % suppress most overshoots
```

It looks like you are losing bytes to a TOS buffer overflow rather than to
the ACIA problem. If you don't want real time MIDI handling the following
trick might work (I've never tried it myself but from what I know of TOS
it should be 99.9% reliable on a bog ST and 100% reliable on anything faster):

(1) Make a call to XBIOS (can't remember off hand which one) to get the
address of the MIDI buffer record and patch in a much larger buffer of your
own. (This helps avoid buffer overflow.)

(2) Send the IKBD a message to stop it transmitting. (The TOS IKBD handler
is _by far_ the worst offender when it comes to locking out interrupts.)

(3) Read you sysex message in a tight loop using BIOS. (GEMDOS is _much_
slower and gives the buffer more chance to overflow.)

(4) Send the IKBD a message to re-enable transmission.

(5) Remember to replace the old MIDI buffer before your program exits
otherwise TOS will end up writing MIDI data into the next apps memory space.

Steven

SCSI == flat 50 pin SCSI plug, not matter what size the device is. To
fasten a 3.5" device in a 5.25" hole, get a standard adaptor frame (about $5).
As for the centronics SCSI plug you want, that can be had if you purchase
the correct cable set. Internally, all SCSI stuff uses 50 line ribbon cable,
which can go to various types of external SCSI jacks. Thus, all bare SCSI
devices have a 50 pin jack for the flat ribbon cable plug.

Just about any drive fabrication place could supply you with the cable you
want, and the adaptor frame (with faceplate) for size conversion. One that
does ST stuff is Toad Computers (1-800-448-TOAD).

1334. Converting TOS filenames to real filenames

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-11 16:26:30 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <2lq63m$m4b@percy.cs.bham.ac.uk>
Source record: 33867

Is there any way of converting a filename in the TOS domain
(u:\foo\bar\bletch) to the corresponding filename in the MiNT domain
(like in the MinixFS)?

For instance, the string returned by the file selector assumes
Pdomain(0), and the ARGS string returned by Dragging and Dropping from
the MTOS desktop also assumes Pdomain(0).

Thanks!

Help...my Mega 2 ST with TEC bus board keeps rebooting whens it's been on for a few hours. I have reseated all the chips that I can and I am wondering if anyone has any ideas what else I can do. I don't even get the TOS 2.06 Fuji before it resets itself and the only way I can clear it up is to let it cool down. Most frustrating/annoying.

Do you use GEMAR 2.01? GEMAR 2.00 won't work on the FALCON!

> (Luckily I had a program on the IDE drive to reset the SCSI bus).

What's the name of the program and where can I get it?

Allthough it is a good idea to increase the MIDI (and RS232) buffer, it is
not a good idea to do so within an application. This should be handled by
an auto folder program.

>
> 1. Are there limitations on drive speed? [...]
There are always limitations, but if the interface is slower than the potential maximum transfer rate of the interface, you get slower transfer. Anyway, I use it with a rated 12ms drive and get some 1.2 MB/s average.

> [...] My old Supra interface cannot
> talk to a drive with a 10msec response time. Is this true of the Stacy
> interface too? [...]
Have to try it and see. Some dealers may allow you a trial time to return a drive if it doesn't work. The problem may not be one of speed, but that the interface cannot handle parity-check-enabled set drives.

> 2. Can the internal SCSI interface handle daisy-chaining? [...]
The Stacy card has a local address DIP to set it's ID#. It daisy-chains the DMA out to the external DMA port, but has no provisions for SCSI chaining. It _might_ be able to handle lun#0 and lun#1 on the selected DMA ID#, assuming your HD-driver software can handle this.

> I could imagine it being useful to swap the cables around so that the
> internal SCSI is brought to the outside of the case.
Good imagination :) The Link is easier. GE-Soft may be more flexible with regards to the now more common parity-check-enabled drives.

> 3. Has anyone tried using both the internal hard disk and an external
> hard disk? If this works then must both use the same drive controller
> software? I have a Supra 20Mb which works well. Can I use the Supra

> use AHDI?

Not sure what you're asking here, really. Everything is actually on the DMA (with internal adapter to SCSI and the internal drive), so the same HD-driver handles everything.No problem with several (different) drives. You can presumably use any software that's well-behaved and has the performance you require.

3 1/2 inch SCSI drives have 50 way connectors. its the 2 1/2 inch IDE ones that have 40 way connectors. You can surely get a 5 1/4 inch holder for a 3 1/2 inch drive from a PC shop.

Someone else just posted some assembly that will do the trick. the above is
good to know however -- thanks for telling.

> Fforce(1, outfile) ; /* redirect STDOUT */
> Pexec(....) ; /* child process will *inherit* redirected handles */
> Fclose(1) ; /* IMPORTANT because of GEMDOS bug */
> Fforce(1, -1) ; /* restore output to screen */
^^^^^^^^^^^^^
This is the thing that's been giving me headaches. I had the redirection
working, but couldn't find a decent way to 'undo' it. Why ain't this
documented somewhere??? Pfff...
The solution I had found in the meantime was to create a new file handle for
stdout, using Fdup(), and redirect handle 1 to this new handle instead. It
did work, but I found it rather inelegant.
This one's gonna end up in my series of 'never-to-forget stuff' :-).

> /* outfile may or may not be usable at this point - I don't know... */

Outfile is perfectly ok at this point -- I just checked.

>Note: if you omit the Fclose(1), GEMDOS will "lose" a file handle

And I thought I had decent books on the ST... Where did you get this wisdom
from??

Thanks a bunch for all the above -- it really solves a few horrible puzzles.

I would NOT call Flash 2.x an upgrade from the excellent Flash 1.6;
it is a downgrade. I bought Flash 2 and got a couple updates to it in the
mail, and it is one of the BUGGIEST pieces of crap I've ever seen on the ST,
and that's saying a lot, since there are a LOT of crap comm programs on the
ST. (There are 3 good ones). If anyone actually likes Flash 2.x, then I guess
you have no serious use for a comm program.

Which version of 'GEMAR' are you using with your Falcon, Erling?
I recall that GEMAR v2.01 addresses a minor bug with Falcon SCSI
code, perhaps this is relevant to the problems you have encountered.
I have never tried an Exabyte exb-8200 video-8 streamer nor do I
have a Falcon, but I hope this suggestion to try v2.01 is of some
small help.

The old Supra interfaces were not full SCSI adapters. They supported a
minimum of the SCSI bus, and worked only with specific older drives. In
general it cannot handle any newer SCSI drive, regardless of speed. If the
Stacy contains a proper, genuine SCSI interface, there should not be any
problems.

> 2. Can the internal SCSI interface handle daisy-chaining? Can it drive

> This way I could connect SCSI disks directly without buying another, possibly
> incompatible, ACSI to SCSI interface.

Due to the active low with pull-ups nature of the SCSI interface, there is
no reason that the STacy shouldn't handle it. Just be sure to have the
termination packs on the last drive only.

I couldn't answer that one. If you find a STacy supplier, I wouldn't mind
finding out where and who etc... I could use one myself.

Our terminal program, TAZ has a slight snag when running with NVDI. When the $A00A is called to turn off the mouse, our program is kicked out to the desk-top when NVDI's line-A emulation is turned on. Our code has run fine with all versions of tos on the ST, STe, TT and Falcon; no problems with Warp9 either... Our documentatin (ST Internals) does not detail any parameters for this call. Is there something we should know?

> it should be 99.9% reliable on a bog ST and 100% reliable on anything faster):

The analysis is correct (the default MIDI input buffer is only 128 bytes), and the method Steven describes will work. I'll just add a few bits of information that may be helpful.

> (1) Make a call to XBIOS (can't remember off hand which one) to get the
> address of the MIDI buffer record and patch in a much larger buffer of your
> own. (This helps avoid buffer overflow.)

That's XBIOS(14), i.e., IoRec, for device 2 (MIDI). You'll get a pointer to a parameter block with (buffPtr, buffSize, headIndex, tailIndex...). buffPtr is a LONG, the rest are WORDs. The maximum size buffer that TOS can handle is 32 kB. If you need to be able to capture more than that in one chunk, you'll have to be able to pull it out in close to real-time.

> (2) Send the IKBD a message to stop it transmitting. (The TOS IKBD handler
> is _by far_ the worst offender when it comes to locking out interrupts.)

That's the IkbdWs routine, XBIOS(25). Message 18 shuts off just the mouse (the worst offender) and 8 turns it back on. Message 19 shuts down the IKbd completely, and 17 tells it to resume.

> (3) Read you sysex message in a tight loop using BIOS. (GEMDOS is _much_
> slower and gives the buffer more chance to overflow.)

True, but even the BIOS is way slow. Each read-byte or check-for-byte-ready takes a good chunk of a millisecond, due to Trap overhead. You could just pull your data out from the buffer directly, using the Head and Tail index variables. Or, if you don't mind having real-time messages like ActiveSensing, etc embedded, you could just point the IoRec _directly_ into your data buffer, then shut it off when recep-tion is complete.

> (4) Send the IKBD a message to re-enable transmission.

That's 8, or 17, as described above.

> (5) Remember to replace the old MIDI buffer before your program exits
> otherwise TOS will end up writing MIDI data into the next apps memory space.

Good advice, and easy to overlook when you're struggling to get something operational.

The Stacy's SCSI controller is the same as in the Mega STE (surprise!), only
Rev. -002, while Mega STEs have -003.
Limitations are: Parity isn't supported, FastSCSI drives most probably won't
work - just like older third-party adaptors.

> 2. Can the internal SCSI interface handle daisy-chaining? Can it drive

The internal SCSI controller handles no more than ONE drive.

> 3. Has anyone tried using both the internal hard disk and an external
>hard disk? If this works then must both use the same drive controller
>software? I have a Supra 20Mb which works well. Can I use the Supra
>software to format and use a replacement internal drive? Or do I have to
>use AHDI?

No problem in having external ACSI stuff. One of my customers has a Stacy with
internal 40 MB Conner drive, and temporarily hooks a daisy chain of an Atari
SLM804 printer, a GE-Soft TOPLINK SCSI adaptor, a Syquest 3105S and a Maxtor
7345S drive to it (all at the same time). No problem at all. Use Atari software
for formatting.

>>>>>>>>>>>>>>>>>>>> IMPORTANT NOTE <<<<<<<<<<<<<<<<<<<<

The Conner drives used in Stacy have a severe firmware bug.
Usage of any other formatter than HDX 3.02 will cause the drive to hang the
system immediately.

You're free in your choice of drivers, though.

bye, Peter

Just off the top of my head ... you could (with Minixfs) chdir to the
parent directory and then get the proper name with getcwd. After that
you lookup the inode number with stat of the file and use opendir/readdir
(which in normal mode don't get translated even in TOS domain) and find one
which matches, if you have multiple links in the same directory then you
could compare the two names and see if one woul get translated into the other.
Steve.

1350. How di I download stuff from a Unix Box to my ST via modem?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-12 14:06:03 UTC
From: vctec@westminster.ac.uk
Message-ID: <CMK1u4.LMw@westminster.ac.uk>
Source record: 33883
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Dear Friends,

Just got a modem, and have been dabbling with the various Comms programs from Atari Archive.

So far, I quite like Flash II (the crippleware version) and Connect (Another crippled). Haven't tried Storm yet, but will do, and can't get Fizzy to work.

Oh well, never mind, I'll figure them out sometime.

In your opinion, which is the best comms package, and why? I know this is an old question which has been asked millions of times, so please, send your messages to me and not on the net. I don't want to create any flame wars.

I can login to college and bulletin boards via modem using Flash and Connect (Connect sometimes brings up garbled stuff on the screen instead of text....anyone know why?), but how do I download direct to my hard disk at home using my modem....This is killing me...I just can't figure it out.

Say, I've got stelm.lzh in my home directory at college....how do I get it onto my hard disk at home?

I have MINIX on my system....and the terminal program on that is quite good for my needs....so far.... Now MINIX has Kermit, but the Docs with Minix are not very goos. Do anyone know how to use Kermit from within Minix? I've nearly got there, but nothing ever seems to be downloaded.....always get a time out error.

So anyone use Minix for downloadiung? How do I use Kermit successfully from there?

I await your replies....

Thanks.

Oh, and yes....I'm sure a lot of newcomers would like this info too, so, please

Hmm... In theory this might be true, but in practice I've never had any
problems with replacing the MIDI buffer by a custom buffer. Just install the
new buffer immediately before you need it, and uninstall it immediately
afterwards. That way you'll minimize the chances that things go wrong (i.e. if
the program exits while the new buffer is still installed, chances are high
you'll crash your machine).
The disadvantage of an auto-program is that you need a *seperate* program to do
the work, which is esthetically very unsatisfactory imo.

Source record: 33885

Well, the subject says it all. Ishar 2 freezes on me a lot. I own a Falcon with no internal HD, (external SCSI), and a VGA monitor. I also have tos 4.04. Could this be the reason it is freezing on me (the tos 4.04?)? Perhaps they programmed this game on a TOS 4.01 or 4.02 machine. I remember someone else posting a message about this same problem not too long ago, and I am wondering what kinds of solutions I can try! Ishar 2 is a great game but it is hard to get anywhere on a RPG if it keeps freezing on you.

It is documented in the Atari Profibuch by Jankowski (?sp), Rabich and
Reschke. The original distribution was translated to dutch, but does not
include (Mega)STe/TT. Later editions are only in german. The Profibuch
does not (yet?) include documentation on the Falcon.

The 2 1/2 in. IDE drives have a 44 pin connector which includes 5V
power supply. The 3 1/2 in. IDE drives have a 40 pin connector and a
separate "disk drive" power connector.

gcc -ansi -U__STRICT_ANSI__

-ansi turns on the ANSI-ness; it should work even without -ansi, but you never know.

-U__STRICT_ANSI__ undefines __STRICT_ANSI__, which is probably only necessary if you're using the MiNTlibs; this leaves in some very handy stuff that isn't 100% ANSI compliant, but that you'll need anyway.

From: winnipg@sys6626.bison.mb.ca
Message-ID: <aJu4ic9w165w@sys6626.bison.mb.ca>
Source record: 33890

I need to replace my internal drive with another 720k brand. What should I get? Teac is mentioned alot. Is it 100% compatible? Will it work with cache programs like acache?

The drive I have now- Chinon FZ-354 doesn't recognize a disk change unless the disk is write-protected. Any way to fix this? Anyone have the same drive?

I had the media change pin(2) and the write protect pin(28) hooked up and that made the comp recognize any disk put in but it created a new problem because 90% of the time it thought all disks were write protected and therefore copying/deleting files was a no-go.

1358. Re: How di I download stuff from a Unix Box to my ST via modem?

The adantage of an auto folder program is that the buffer will be used by
any application using the MIDI-interface. This is a very satisfactory
feauture imo ;-).

>Reschke. The original distribution was translated to dutch, but does not

I do have the Profibuch, of course, and it's never more than 1 meter away from my ST, but in the paragraph on Fforce() no mention is being made of any method to undo redirection. If you could point me to the place where this *is* mentioned, I would be eternally grateful (NB, I have the Dutch Profibuch, so mentioning page numbers from the German edition won't do :-).

Afterthought: The Profibuch still is my ST-Bible -- an absolutely wonderful and invaluable book. But... why didn't they make a decent index or table of contents for it? Half the stuff I try to look up simply is not in the index, and the only solution then is to make a wild guess or scan the book from front to back...

Here is your chance to win an Atari Jaguar!

The Atari ST Users Group of Winnipeg is holding a Jaguar raffle to raise funds for various club improvements and to participate in a major computer show. The tickets are $2.00 each and only 2,000 will be sold.

If you would like to enter the raffle please send a money order to:

Atari ST Users Group of Winnipeg
5-390 Carpathia Road
Winnipeg MB R3N 1Y4

The draw will be conducted at our Annual General Meeting on May 12, 1994. The announcement of the winner will be posted to GEnie, Internet, FidoNet,
and AtariNet.

Be sure to send in your order at least 2 weeks before the draw. If the tickets sell out we will return your payment.

Don't miss out on this chance win your own 64 Bit Multimedia Home Entertainment System.

Source record: 33799

I am a new atarian after buying a Falcon a couple of months ago. I am looking t
o do professional video production, music, and other crap with it. First of al
l I purchased the falcon speed (286) and I find it rather slow. I want to upgra
de to the 486 version with the possibility of using PC CD Rom's, graphics progr
ams such as 3d studio, photo shop, and all that other jazz stuff.
Right now I am in a wait and see state because the only info i get is through s
illy mag's such st user, st informer etc... ---they dont give any specs on indi
vidual items for example -- who is the manufacturer of the cpu for the falcon
speed. What I am saying is that it's not ecxtensive as pc mag's. Also, I find t
hese mag's dated,even that new one's it seems like atari is 3 years behind. I a
m not interested in all of the lingo or it I am only an end user. I am frustrat
ed right now so instread of trying to explain myself I am going to list a few o
f my reservations ---HEERE GOES!!!!!!
1) I would like to usepc cd roms on my falcon
2) I am interested in purchasing he VES 300 for the falcon--- a video hardware
software combo for the falcon --it suppose to blow the video toaster out of the
water!!!! If you no anything about it please let me know it is made by wizat
ronics.
3) I would like to see a comparison between pc software vs. atari software i.g
. Chroma studio vs. 3d studio or indy by silicon graphics--- das vector vs. pho
to shop fractal -----simple stuf like that !!
4) I am looking for the 32 mhz expansion board for the falcon
5) Just how fast is the 129 fast TT ram if I decide to gat it
6) I need a beter support system I am tired of going to a bookstore and seing a
ll of these books for the pc and mac world the falcon is a terrific piece of h
ardware I am hoping it will produse the same results in the software de
partment
6) where can I upgrade my 03 to a 04 board --wizatronics as well and what softw
are will take advantage of it if I decide to do it
7) not a question----- I am happy with the falcon music capability I must say
for 8 tracks on the pc I would have to shell out 3,000 dollars and for ot even
half the price I got a computer to go along with it ;-)
8) anyway i am willing to support atari and it's falcon as long as THEY WILL SU
PPORT ME BACK IF NOT THE COMPANY--THE DEVELOPERS I like the operating system
Windows it too boring for me !!!! at least with atari every software is diffe
rent with a different system not unless it using the gem desktop---
----------anyway if you know anything about chroma 24, ves 300, an

d any other nifty software under development or out please let me know and I wi
ll be utterly happy with my purchase --if not, I will comit this thing to its o
wn fate suicide --just kidding. for the most part I need cd rom support and
not the hocky sherware atari stuff--- desktop video software as well
video and music stuff oh and pc stuff forgive the way this is written and forg
ive the stuff and the the oher stuff ☺-} but I am just another falcon frustrate

d user --not uless there is someone who can unfrustrate me!!! ;-) signing of
--irst time user------ ray

Hmmm, maybe it's time for an update? :-) I'm using the 12th edition (yes,
it's in german, but it didn't try to eat me ;-)), there may have been
some corrections in later editions (Julian, are you reading?).

Anyway, in the dutch translation it is on page 30 (section "Handles"):

"Verolgens zijn er de ``standaard tekenapparaten'', die door
GEMDOS worden gedefinieerd:" ...

> Afterthought: The Profibuch still is my ST-Bible -- an absolutely wonderful

I don't use the index, usually a peak at the table of contents is good
enough for me. Maybe that's because through the years, I've come to learn
the book by heart ;-).

Message-ID: <1994Mar14.103205.43612@urz.unibas.ch>
Source record: 33802

hi,
there are the following three laser printers i'd like to know something
about for using with my atari:

- HP 4 (4L ? the smallest one)
- TI (the smallest one)
- Sharp (the smallest one)

the TI and the Sharp are much cheaper than the HP but they seem to be
more comfortable (LCD Display, etc which the HP doesn't have).
so which one is prabably better for my atari? or is there no big difference?

thanks in advance,

Just attach a SCSI CDROM and use ICD Pro utilities to get it up and running. No Problems. You will be able to read data, fonts et.c but not run the software itself such as Corel Draw but you will be able to use the clipart etc. I don't know if falcon Speed will allow you to access it at any kind of usable speed. Mail compo@cix.compulink.co.uk and ask them.

The last few years a home-made textpacker was used to pack the text, the packer of the old issues is probably ICE.

This thread interests me because I was interested in the idea of writing
a filter which would process MIDI input before it reached a sequencer
program. Would it be enough to trap the XBIOS call where the sequencer
reads the MIDI port, or do some sequencers by-pass this?

Is there, or will there ever be, an English edition? The Compendium's
good, but not everything is covered (eg MiNT XFSes, XDDs, etc).

Well, the version of ICD I used allowed you to turn off the boot delay
if I'm not mistaken... Perhaps you need the newer software?

Roger> This I think is the later 6.4.3 Booter.....

I have 6.2.3...

Just FYI, but ICD PRO also has a workaround for this bug. Anybody who tries
to format the drive using ICD PRO had better read the documentation first.

Thanks for all the replies.
However, I had already incorporated the MIDI buffer enlargement routines in my code.
They actually didn't seem to make any difference, even though I thought they would.
(OK, my code could well be wrong...)
What I would like to know is - would it be faster to write the input loop in assem.
then call the routine from GFA and then pull the data from the buffer after it is input?
Is this complicated?

Thanks

From: magic@mtu.edu
Message-ID: <2m2a4b$1p9@maxwell20.ee>
Source record: 33814

Currently I am attempting to connect a Megafile 20 to my Mega ST4
with an internal 45 MB Supradrive...I have the drives configured with
different SCSI device numbers, and I can format both sucessfully.
The problem is that the Supra Utilities will not let me format the
Megafile other than starting with partition C. Once I have both formatted
the Computer refuses to do anything...it finds 2 C drives and refuses to
co-operate...any help or info would be greatly appreciated.

Thanx

I find it irritating as well, and have suggested that they make it a
configurable option in future releases. At this point, I know of no way
to actually get rid of it. Thus, if I am in a hurry, I whack the space
bar (this aborts the pause).

From: dbanarse@sees.bangor.ac.uk
Message-ID: <2m2eja$5vj@clss3.bangor.ac.uk>
Source record: 33817

Could anyone please help me....
I own a second hand hard drive which seems to have been built by the previous owner. It works usually although I have a number of problems with it. Firstly a bit of background....

The hard drive is a Rodime RO203E. This is connected via a 34 way ribbon and a 20 way ribbon to a controller made by Xebec ('Ass Y' if that means anything !) The controller is connected via a 50 way ribbon to another PCB. This board is made by BBDP Electronics (the board is marked AT6000) and has a 20 way ribbon which is used to connect to my STE.

When I first got the drive it used to autoboot but crash just after the driver printed its installation message. I guessed that the driver (which had been working fine on the previous owners STFM) was incompatible with my STE. I am currently using Supra hard drive utilities and have tried installing the Supra autobooting driver onto the drive. This has limited success. The STE still needs to be booted from a floppy with a program that tells it that the drive is there. If I let the drive come up to speed and then switch on the STE without a disk, it eventually boots with just the A and B drive icons. Using the Supra program on the floppy disk starts the drive accessing. Then, if I reset the STE it boots from the hard drive.

More importantly the drive sometimes 'locks up' whilst accessing the drive (usually the more intensive accessing), i.e. the access light on it stays on and nothing on the drive can be read. I have to restart the drive and reboot the ST from floppy. This quite often results in the loss of the contents of the directory that the ST was accessing at the time. With inspection of the directory using KnifeST there is no trace of the files that were there.

I have a number of questions that I hope some of you will be able to answer.

1) Has anyone heard of BBDP Electronics ? They used to be based in Scotland but I cannot make any contact with them. I think they may have gone out of bussiness.

2) Does anyone know of any BBDP hard drive drivers available anywhere ?

Failing the above) Is there an autobooting driver that I can install on the drive allowing it to autoboot (like it used to but without crashing!) ?

4) Is the drive locking up probably due to the fact that I'm not using proper BBDP driver software or is it more likely to be the hard drive just falling to bits ?

5) Very occassionally the drive suddenly starts to slow down to approx.
half speed and a little red light inside starts flashing. I have to then
turn it off and on again.... any ideas why this may be happening ?

6) What type of hard drive have I got ? I guess the Xebec contoller accepts
SCSI signals from the BBDP controller, is this correct ?

7) What would be the alternatives to the BBDP controller and/or the Xebec
controller ?

ANY help would be gratefully appreciated !!
Thanks in advance,

Dylan

Hello folks!

I have been trying to find a way to turn off the IDE drive in the Falcon (i.e. put it to sleep) using the Port A bit 7 but it does not work. Apparently that bit is shared by the SCC controller as well. And it does not help that the latest version of HDX does not have a 'park' option (why did they take that out?)

What is the way to do this?? I am specifically trying to put the IDE drive to sleep and then issue a call to make it spin up when I need it to. Any help will be much appreciated.

Ta Ta For Now,
Michael Fung

> course :-).

Okay, seeing as how Gemdos so closely follows MS-Dos, and Gemdos supports functions $45 and $46 (duplicate handle, and force), this little tidbit from a Norton code may prove interesting: (paraphrased)

Function $45 duplicates an open file handle and returns a new handle that applies to the same device or file. All actions performed on one handle will be reflected in the other handle, the new handle does not act independantly in any way.

You can use function $45 along with function $46 to implement input/output redirection. You can also use uit to commit an open file to disk by duplicating the open file's handle and then closing the duplicate. This has the effect of flushing the buffers and updating the directory without the overhead of closing a file and re-opening it (which involves a directory search), and repositioning the file pointer.

Function $46 (force duplicate handle) is misleading named, because it does not create a duplicate handle. Instead, $46 associates an existing handle with a different device. This is the key to implementing I/O redirection in Dos.

Call function $46 with an open handle in BX and a second in CX (hmmm, not sure which order you'd be passing these parameters with Tos, ST internals is less than descriptive about these two calls). When the function returns, the handle in CX is associated with the same device as the handle in BX. If the second handle was previously associated with an open device, that device will now be closed. A redirection example (pseudo coded, as Tos is stack based, not register based, and I don't know what order the parameters go in (ST internals is ... etc)

```
stdoutDup = $45( stdout ) /* Set standard out to some file */
$46( somefile, stdout )

... useful code here ...

$46( stdoutDup, stdout ) /* Put standard out back the way it was */
close( stdoutDup ) /* We won't be needing this anymore */
```

Now if we could only figure out the order of the parameters. Experiment and have fun... If you can get this to work, I would recommend it compared to stealing vectors and other such nasties.

You realize, of course, that this is exactly what the booter is waiting
for? (A keystroke...) ICD's booter allows you to tell the system,
via a single keystroke, which drive to look on for AUTO and .ACCs.
I find this incredibly useful for the rare occasion when I need to
set up my old STfm. I simpy hit the 'J' key and the AUTO/.ACC config
I used to use before getting a Falcon are now still loadable from
my Syquest cart...

> so which one is prabably better for my atari? or is there no big difference?

If cost is not a consideration, get the HP 4L. Because it has resolution enhancement, you'll get somewhat better quality, approaching 600 dpi in appearance. Also, if you're considering the Postscript versions, the HP 4ML has more resident fonts than the other base versions.

If cost is a consideration, get the TI. Benchmarks I've seen indicate it's somewhat faster than the Sharp, and I believe TI's feature set (i.e., ROMs) may be a bit better.

Also, if you have a runaway printout, you can reset or shut off the TI and Sharp units. But the HP has no buttons or power switch, so I think you'd have to yank the cord out of the wall. :-) Also, even though the standby power drain is extremely low with the HP (about 5 watts), unless you plug it into a power strip it isn't too convenient to shut it off. And it'll burn $3-4/year of electric just sitting there (about the same as a small nite-lite).

What you're going to use it for will have some impact on which would be the "best" printer for your application.

Probably a case of RTFM.

From the WHATS.NEW file of 6.2.0 .....

W H A T 'S N E W
==========

ICDBOOT v 6.2.0

[....]
There is now a 3 second delay to allow you to read the ICDBOOT "Current
driver settings" configuration data. The delay may be cancelled by
pressing any key. If control-S is pressed execution halts until any
other key is pressed. This allows more time to read the configuration.

Try the FALCONSX.ACC desk accessory! It's a great utility for Falcon030 users which allows switching the CPU and BLiTTER independently between 8MHz and 16MHz, switching between the Falcon BUS and STE-compatible BUS, turning the IDE hard drive on and off, setting the audio system (input & output gain levels, sampling frequency, the audio system matrix), and a few other things. It's available on atari.archive.umich.edu in the atari/Falcon/ directory.

You need to run a patch called FMC.PRG in your auto folder. This program (Force Media Change) forces the OS to check for a disk change before every read/write operation.

Apparently, the latest version of Gemar is 2.20:
ftp.uni-erlangen.de:

./archiver/gemar220.lzh GEM-Archiver v2.20 - run SCSI-streamer (ST/TT)

Note that I just remembered seeing in it in the listing. I haven't used it on
my system.

I found that the ICD driver boots much faster if you turn off all the unused
SCSI IDs (using the configuration program, forgot its name).

Bye,
Jens.

Hello,

I am looking for some information to find out if I can buy an external HD disk drive for my MSTE. First of all, is there such a thing I could use? Secondly, would I have to do anything to my MSTE to use it? Would it be better just to get the upgrade for the internal? Is there any problems with games and other disks while trying to use the on the new internal HD drive?

I think that is all I need to know. If there is anything I left out and I should know, please include that in a response.

Thanks,

Joseph

Yes. Extremely annoying, that delay! There should be a way of configuring
it away. 3 bloody seconds! Makes MultiTOS programming a hell :-)

> my Syquest cart...

I do realize this. What I am lamenting is that there does not appear to
be a way to turn the 3 second delay off, for those of us that don't need
this feature, and don't find it necessary to read the configurational
information that the booter throws on the screen every time. IMHO, this
should be a configurable option changable with hdutil.prg (zero seconds for
no wait, one second for those with normal dexterity, etc. :-). I personally
view the bootup process as one that I can safely miss watching, in general.
It is not a big deal, but it would also not be very difficult for ICD to
implement a fix.

1408. gcc and zsh... odd behaviour

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-15 23:27:09 UTC
From: ypelletier@cid.aes.doe.ca
Message-ID: <CMqBtA.HI9@cid.aes.doe.ca>
Source record: 33741

I got zsh a couple of weeks ago, and I like the "feel" of it,
but I've run into an annoying problem that's resisted my poor
newbie-ish attempts at finding a solution.

zsh generally behaves normally, i.e. it will run programs like
ls or rm without problems. However, when I try:

gcc hello.c -o hello

All I get is a spurt of hard drive activity, as though gcc is
being loaded. Then I am immediately returned to the shell
prompt with no error message. Would anybody be kind enough
to shed some light on this? I used to be able to use gcc with
my old shell without any problems. (I switched because I wanted
a Mint-aware, case-sensitive, shell.)

Thanks

Yves

Hi,

I'm a bit of a green ST programmer, but I'm looking at doing some work with GEM using the C compiler that came with ST Review a couple of months ago. The main problem is I have very little source code to learn from. Any ideas where I could get a useful C graphics library and some source code for a decent GEM program? Any ftp sites or email addresses to try would be appreciated.

Cheers
Bruce

Hmm - replying to my own article... :-)

I tried with gemar2.20 yesterday.
It sort of works now.

The trouble was the setting of transfer speed. I just can't see how
this could have any effect, though.

Anyway, I sat transfer speed to maximum (1024kb/sec), and I was able
to make a backup.
There were however a few other quirks, but the backup seemed to
be fine. I suppose I'll get it working better if I hand-tune some
of the other parameters.

I was not able to fast-forward the tape, though. Rewind worked
fine, but when I pressed the forward button, the exabyte complained
about "Command not understood" (or whatever the german message was).

Also, it always bombed after completing the backup - but the backup
process went fine. The only trouble was that there was no way
to verify the data written to tape. (I guess this is about when
the program crashes, after writing the last index and rewinding
the tape, and before starting to verify).

I did a small test, backing up ~10 Mb of data, then I restored
it to another partition. Then I compared all the files - and they
were identical.

The troubles I describe might disappear with more
careful configuration - I did not have
time to study all the docs last night.

Erling

From: marc@wan.inf.rl.ac.uk
Message-ID: <14651@hardy.rl.ac.uk>
Source record: 33746

Anybody have any experience of swapping out a 68K chip for a 68010 on
either a v.old 520ST-M or a later FM? I swapped the chips ok, but the
ST crashes about 5 sec after power-on.

I understand that although they are pin-compatible, there is at least
one instruction that will cause an exception if not executed in supervisor
mode on the '010 which is not the case on the 68000.

Any info would be appreciated,

Cheers,
Marc

1414. Mint with FASTTEXT ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-16 13:08:48 UTC
From: csulw@csv.warwick.ac.uk
Message-ID: <2m70d0$9qo@lily.csv.warwick.ac.uk>
Source record: 33747

I've been using Mint 1.10 for a few weeks now, with no problems, but
I was wondering what exactly does the -DFASTTEXT option do ?

Looking at the source, it appears to be something to do with hardware
scrolling, or am I completely wrong? I compiled it with this option
last night, but I can't see any difference (on a Falcon TOS 4.04).

What programs will I see any improvement in (faster text output?) ?

Thanks for any help,
Paul Donovan

Maybe I'm being stupid here, but why use LineA to turn off the mouse when
you can use the VDI or AES to do the same? It's not like you're going to
gain much speed...

From: coutu@decvax.dec.com
Message-ID: <2m7grh$qpe@nntpd.lkg.dec.com>
Source record: 33749

Thanks for all the feedback! It has been most helpful.

I'm still in experimental stage right now. I plan to
experiment with a low profile SCSI drive from work to
see if it will work correctly. If it does then what I
have in mind is getting a Quantum ELS 170 to put into place.

I have booted the Stacy off my external Supra by the way.
I just had to open the Supra box and change the SCSI ID
jumper so that it wasn't 0. This was much easier than
opening the Stacy to change the SCSI ID of the internal
drive! :-)

I'll let you know what else I learn as I try things.

Thanks!

Dan

-DFASTTEXT compiles in code for providing u:\dev\fasttext, which is just like u:\dev\console except it's faster. You can make this device your console using the CON= configuration option in mint.cnf.

Note that MULTITOS does not provide the u:\dev\fasttext device by default. In order to enable the device you must compile MiNT *with* -DFASTTEXT and *without* -DMULTITOS.

CON=U:\dev\fasttext

Do you have that line in mint.cnf?

> What programs will I see any improvement in (faster text output?) ?

All programs writing to the console (stdout & stderr are usually
directed to the console when you start a program from the shell).

[...]

Yes - do not use any LINE-A-call ! Using the AES-calls to turn the mouse
on or off is the better way and does also work fine with NVDI.

Install FPatch2. The best package to use on a Falcon (assuming you have a
VGA monitor) is Connect.

Another difference which is much more serious is the stack frame
format on interrupts. This is definitely not supported by any TOS <=
1.04. You will probably need TOS 2.06, but i'm not sure if it will
recognize the 68010 correctly.

I think the 68010 uses the long stackframe rather the one used by the 68000,
so for using a 68010 you need at least TOS 1.62 to cope with it. I know
someone who has a 68010 in their STE with no problems.

1427. Calligrapher Problems, Please Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-17 10:43:23 UTC
From: mcssesw@dct.ac.uk
Message-ID: <1994Mar17.104323.11172@dct.ac.uk>
Source record: 33760

I have written a 16 page document in Calligrapher Gold III with four graphics files imported. The first two .IMG graphics and the last image print OK. However the third graphic on page 6 will not print.

It is just the one graphic file that it doesn't like. I have tried taking graphic 3 out and replacing it with graphic 1. Calligrapher can now print page 6. I later tried loading in graphic 3 into MegaPaint and tried printing from there, perfect results.

Has anyone got any ideas?
Has anyone else seen this bug?

Hi netters,
Here in my office we have many X11 NCD terminals and I was quite surprised to see that they use Bitstream fonts. I asked the sys-admin if I could download these fonts and I installed them on my Atari BUT I can't have anything else than the letter "g" appearing on my screen.
So, is there something to do whit this fonts ???

Thanks in advance for the response.

As I recally fasttext sets up a device with that name of the U; directory which you can pipe all text output through for faster output.

Ypu have to set up some stuff in the mint.cnf file or something. Get an earlier version with the docs for more info.

Michael

The Speedo fonts with X11 are encrypted differently to the Speedo
fonts that Atari/Word Perfect/etc use. That is, they are unuseable by
SpeedoGDOS.

However, (a light at the end of the tunnel?) Speedo 4.2 (out RSN) will
have this capability.

Don,
As far as I know, Adaptec didn't make a DMA interface, they made controllers that would allow MFM/RLL drives to be connected to a SCSI port. The companies that made the DMA to SCSI interface often packaged an Adaptec controller with their product. The DMA-to-SCSI interfaces that I know of are from Atari, Supra, BMS, and ICD ... nowadays, the only manufacturer is ICD.

Of the above, only ICD made/makes an adapter that allows the use of the full SCSI command set. I sell a CD-ROM driver package that works well in that environment. The package _could_ be modified (with a slight loss of functionality) to run on a non-ICD adapter. Let me know if you're interested.

1437. AP_TERM and AP_RESCHNG messages.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-17 17:46:48 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar17.174648.11867@beaver.cs.washington.edu>
Source record: 33770
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I know to receive these message from AES version 4.0, you need to send shel_write(9,1,-,-). When I try to change resolutions, I then get an AP_TERM (50) message. At first I tried just exiting by closing all my windows and exiting. This worked fine, and I didn't get an alert saying "Please close all applications before changing resolution."

But then I thought about MS Windows. When you quit Windows on a PC, all the applications put up alert boxes saying "Save XYZ before quiting?" So I thought why not do that in my program. But when I got an AP_TERM message and then tried to put up an alert box, it seemed that the AES had already disappeared and I got a FATAL ERROR. But I was still able to execute rsrc_free() without any problems, which is the AES as well.

Am I doing somthing wrong? Can I prompt the user to quit when I get an AP_TERM message and then send an AP_TFAIL message if the user doesn't confirm the quit?

1438. FZDT, RUFUS, STALKER, CONNECT: losers only?

Since 1.5 years I also access Internet from my very home,
using an obscure terminalprogram named "PC/Intercomm" (v3.01),
written in '89 or '90 for the ST.

It's an okay program, but hasn't got the flashy interface and features
that programs nowadays offer, so I tried a few of the popular ones
and was shocked to find that (compared to PC/Intercomm)
terminal emulation ranges from irritating to a big laugh,
when talking SPEED.

Here's the ones I tried sofar:

Rufus : Slow emulation, and doesn't work well with 'vi'.
STalker : Even slower emulation, and scrolls jerky (I'm not confusing
flowcontrol pauses here.)
ConNect : Slow emulation, with a very annoying 'block-copy-like' text-
buildup in e.g. 'irc' and other types of scrolling, no matter
the settings.
FZDT 2.20: Is the only one sofar that resembles PC/Intercomm's buildup most,
but unfortunately it's vt100-emulation is so sloppy that
'vi' and 'irc' CANNOT be used at all!
Earlier in this group I read a 2.30 version won't be finished
soon (if it would solve this at all).

Obvious QUESTION: * Is programming an IMMEDIATELY RESPONDING!, FLUENT! and
FAST! terminal emulator some kind of well-hidden
secret that only the developer of PC/Intercomm
knew about ?

Either PC/Intercomm will have to be upgraded (? - it ended up in my diskbox
YEARS ago by chance, and I've never met another user or saw it mentioned
anywhere),
or those socalled 'big titles' will have to keep pace with it soon;
I'm not gonna give it up for something that shows me the difference
between 9600 and 14K4 in UL/DL CPS-rates only.

Very surprised,
RowdyB.

1439. Falcon / SCSI woes

I've just got my new Falcon from Gasteiner c/w a 270Mb external SCSI HD. Now there appears to be a problem with the SCSI HD...

1. If I disconnect the SCSI and boot, everything come up ok, I can access the floppy etc.

2. If I plug the SCSI in, I get no floppy drive icons or HD icons on the display. The HD hasn't been formatted, so I don't expect HD icons, but I can't access the floppy at all (installing a new A: icon just makes the bird tell me there's no such drive)

The SCSI mechanism (an HP) isn't terminated, (the row of resistors is missing), so I plugged a terminator courtesy of DEC into the other SCSI slot. There are also no jumpers for SCSI id. There are several links on the board that could be made, but no link connections...

Anyway, I think there's some sort of DMA problem (hence the misbehaving floppy due to the SCSI), so perhaps there is a SCSI id clash (drive + SCSI host chip set to same id ?). If someone has better ideas, I'm open to hearing them.

Failing that, does anyone know what links to set to change the SCSI id ? There are links marked A0,A1,A2 next to each other, which are what I think are the id connections, but I'm not sure.

I'm going to murder the guy at Gasteiner...

Simon.

All of these strive to be "complient", so the use of a third party
acceleration utility like Warp9 or NVDI is highly recommended. The
accelerators have gotten good enough (and wide-spread enough) such that many
other programs do not attempt to use custom optimized graphics routines, but
instead depend upon an external accellerator instead. This is a good
thing, IMHO.

> FZDT 2.20: Is the only one sofar that resembles PC/Intercomm's buildup most,

It's vt100 emulation is non-existant! There is no vt100 emulation in
FZDT. Note that it uses its own custom graphics routines (which are likely
not to be as good as those found in Warp9/NVDI), which is why you perceived
better performance. You should check to see if you specifically set vt100
in all these programs. Some default to vt52. Note that ansi is not
equivalent to vt100.

> Obvious QUESTION: * Is programming an IMMEDIATELY RESPONDING!, FLUENT! and
> FAST! terminal emulator some kind of well-hidden
> secret that only the developer of PC/Intercomm

> knew about ?

No. In fact, all of the programs you have mentioned are excellent. However,
you should either purchase a screen accellerator (NVDI is better, but
expensive) or get Uniterm. Uniterm uses custom graphics stuff, is
nice and fast, and has excellent vt100 emulation. If you get an accellerator,
I would suggest Connect. The "block" effect you mention is not as issue
with an accellerator.

The last version of Uniterm is available only from chsun.chuug.ch
in archive/software/atari/uniterm. It is Uniterm 2.0e015. Get it, and
gszrz228.lzh (from atari.archive.umich.edu). Write two small macros so
you can start Zmodem with a mouse click, and you are set. Feel free to
email if you have problems with the macros. I used Uniterm for many years,
with excellent results. I only recently switched to Connect, after getting
NVDI and a 16mHz machine.

Also, be sure to get HSMODA02 and install it, no matter what terminal
program you are using. This will fix TOS RTS/CTS bugs and give you better
performance. Your vi problems with Rufus are a configurational problem (I
remember doing the same thing, and fixing it with a bit of twiddling).

One last point: for high speed modem use you should set your line speed in
whatever modem program as high as you can (19200 for unmodified STs). Not
doing so will negate any advantage you get from data compression protocols.

: wouldn't work with it, but the operating system and a good percentage of
: his applications worked fine. That's all I can tell ya, tho. <:)

There are differences in software.. The biggest, is all exceptions (TRAP instructions, hardware interrupts, etc) cause 4 words to pushed on to the stack, where the 68000 only pushes three.. This breaks MOST ST programs, including TOS... If you have TOS 2.06, though, you *can* run a 68010.. But, some older programs won't work... Anything written since the TT came out, should work mostly okay..

That's correct. People should STOP USING LINE-A. Switch to VDI. It's just
as fast (after all, it simply calls Line-A on some machines).

There is an .ACC on atari.archive which will (or so it says, I didn't
try it...) "sleep" the Falcon's internal IDE drive. Atari removed
the park feature because the drive is self-parking. No need to manually
ask it to do so.

Just to further clarify - the fasttext driver only has any effect when running
plain TOS programs on the bare console, i.e., without MultiTOS or any other
program that runs TOS programs in windows, etc... The hardware scrolling is
only one of the speedup features; it also does cursor positioning and actual
character output much faster than the ROM TOS screen driver. But if you're
using MultiTOS, TOSWIN, or otherwise running TOS programs under GEM, you'll
never use the console driver anyway, so it's pointless there.

As the author of CoNnect let me mention a few things.

* For a GEM compatible terminal emulator CoNnect is without any doubt the fastest emulator you can get. GEM forces you to take some speed loss into account but using one of the well know vdi accellerators (I recommend NVDI) you won't talk about display speed any more.
* The 'very annoying 'block-copy-like' text-buildup' can be controlled by the user in the DISPLAY dialog. There is a switch 'Fast Scrolling' which you probably haven't found yet. It's a matter of taste if you want to use this switch.
* Try pressing the HELP key whereever you encounter any problems. If you had done so you certainly wouldn't have made the above statements ;-)

Of course, you get a speed increase of -100% if you use a version of
TOS that doesn't know about 68010s (they crash when booting). Clean
versions are 1.62 onwards, which means 2.06 if you have a plain ST.

Gee thats funny, I am using a Supra Host adapter with a Quantum SCSI II
type drive LPS 240 and it works 100% and so does another Supra shoe
Box that I have fitted the same Quantum to..

But my ICD host adapter does not work with the Quantum...!!!

I also changed the Clock IC thats fitted to the Supra to a Dallas one, runs for
10 Years and is very presise...

Glad to hear the Falcon is now up and running. If you haven't yet got it, buy NVDI and pref something like BlowUp030. They make a hellof a difference. I was mildly dissapointed when I first bought my Falcon as it didn't seem much better than my MSTe. After adding NVDI/BlowUp, it finally became the dream machine I had hoped for.
You could also do worse than join CIX in the UK. There are a lot of falcon owners and falcon PD there.

Message-ID: <Up-ECSNAEUQ@deluxe.textlitho.nl>
Source record: 33785

Hi,

Okay, I found FPATCH2 and this is the first mail I'm sending with my Falcon.

!!

The install prg of Upoint allows you to define the ports and stuff and it now runs on port 2 (FPATCH installed).
It won't hang up though after the call - howcome?
I also found Rufus to address the port correctly and I now want to try and set up Binkley. And Hermes. And Connect. And.. :)

I didn't manage to get QFAX to work though. During initialising the modem blinks a bit, but it won't go off-hook (initstring: AT&D2M1L1DT). Does anyone know how to get Qfax working? (I also have TeleOffice, but I never liked it)

thanks in advance,

Paul

Not sure what's causing your floppy drive to disappear from the system,
but one thing you do need to check: if you're using Atari's formatting
software and booter, you _must_ make sure that the SCSI id is set to 0.
With Atari's software, the SCSI devices _must_ be IDed sequentially,
and they _must_ start at 0.

>this call. Is there something we should know?

LineA is reserved by Motorola and should never have been used by ATARI for
screen routines. As of TOS 1.4, the VDI no longer calls LineA. This means
that the VDI is actually capable of being faster (since if you tell the
VDI to draw a line full of text it can draw the entire line at once instead
of making a bunch of LineA calls). Also, VDI is device independant, LineA
will fail on graphics cards and such. VDI is also easier to use since you
don't have to worry about parameters and such. It is now considered poor
programming practice to use the LineA in any new programms.

I would say that you should convert the program to use the VDI, even in
text-mode if you have to! The result will be faster on TOS 2.06, NVDI, or
anything else other than TOS 1.0/1.2 (maybe 1.4). Plus you'll be fully
compatible with the entire ATARI line, graphics cards, etc.

1458. C Library available for driving SCSI devices

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-18 17:33:55 UTC
From: woodford@esca.com
Message-ID: <1994Mar18.173355.9626@esca.com>
Source record: 33790

Hi folks,

In the next few days, you should find a uuencoded zoo archive
in comp.sources.atari.st containing the source to a C library
which I wrote recently. This library provides an easy, device
independent way, to access SCSI targets on the ST(E)s ACSI
bus. Currently, the library supports tape & hard-disk devices
and _should_ support CD-ROM, if my theory is good ;-)
The library currently does not support anything other that the
ST(E) machines because I havn't upgraded, _yet_ ...

I will upload the same zoo archive to a.a.u.e just as soon as
it quietens down enough to let me log on anonymously! The
archive will be called: LibScsi-0.01.zoo

At the moment, documentation on the actual library calls is a
bit lacking but the README file documents enough to get you
going. Anyway, if you intend using the library, you must be a
pretty good C programmer anyway, right? ;-P

Let me know what you think.

Cheers, Steve

It compiles in the fasttext device driver.
>
>Looking at the source, it appears to be something to do with hardware
>scrolling, or am I completely wrong? I compiled it with this option
>last night, but I can't see any difference (on a Falcon TOS 4.04).

FASTTEXT is a console driver that is a bit faster than the standard and
has the option of using hardware scrolling. This only works for text-based
programs that use the full-screen (like if you boot into a shell, like bash,
instead of GEM).

To use it .. add the following lines to your MiNT.cnf
file :

CON=U:\dev\fasttext
HARDSCROLL=AUTO

.. and that should do it. To see an improvement, use Qindex and test the
scrolling.. It should be something like 3000% - don't blink. I've done
other tests and have found that the hardware scrolling can improve text
throughput quite a bit, such as with terminal programs.

Good luck!

I have a note of an address, current in 1992, of BBDP Electronics:

Bob Bell
BBDP Electronics
9 Grey Craigs
Cairneyhill
Fife
Scotland

Sorry I don't know if they are still in business, but perhaps
UK Directory Enquiries would be able to give you a telephone number
to try.

>2) Does anyone know of any BBDP hard drive drivers available anywhere ?

I haven't seen any, but believe that driver software was supplied
with the boards on a floppy disk.

>Failing the above) Is there an autobooting driver that I can install on
>the drive allowing it to autoboot (like it used to but without
>crashing!) ?
>
>4) Is the drive locking up probably due to the fact that I'm not using
>proper BBDP driver software or is it more likely to be the hard drive
>just falling to bits ?

I'm afraid I'm not much help here, but I wonder if perhaps the BBDP
board does indeed require the specific BBDP driver software. I'm not
sure if ICD drivers would perhaps work as I believe they need an ICD
host adapter.
>
>5) Very occassionally the drive suddenly starts to slow down to approx.
>half speed and a little red light inside starts flashing. I have to then
>turn it off and on again.... any ideas why this may be happening ?

The red light inside is possibly a fault indicator, perhaps the
drive motor is slowing down due to an intermittent fault in the
power supply, or the power supply connection may be intermittent due
to corrosion or tarnishing of the contacts in the connector?
>
>6) What type of hard drive have I got ? I guess the Xebec contoller accepts

>SCSI signals from the BBDP controller, is this correct ?

I have some data on the RODIME 203E which indicates that it is an
ST506 type drive, 32MB formatted capacity
640 cylinders
6 heads
Start reduced write current cyl. 264
Start write precomp cyl. 300
Encoding type MFM
Transfer rate 5 megabits/sec
Average access 55mS
17 Sectors per track (512 bytes)
>
>7) What would be the alternatives to the BBDP controller and/or the Xebec
>controller ?

I believe ICDs 'AdSCSI ST' series are along the same lines.
>
>ANY help would be gratefully appreciated !

Hope this is of some help.

How about Tim Oren's 'ProGEM' series -- a series of articles and C-sources that give a detailed description of many parts of the AES/VDI. Really excellent material that I still often use. To be found thru ftp at atari.archive.umich.edu. Probably in the directory atari/Programming -- something like 'progem.zip' or whatever...

1467. Help! 68882 problems!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-19 02:01:48 UTC
From: dsevee@CAM.ORG
Message-ID: <2mdmec$itt@Tandem.CAM.ORG>
Source record: 33708

I tried installing a 68882 (specifically a 68882 FN 16A)
in my Falcon. I found the socket on underneath the power supply,
but when I tried to install it I found the chip was slightly
to small to fit snugly. What is the problem? It seems to be the
right kind of chip, not with prongs, but with loops along the
sides, but it's too small. I contacted Atari and they were
of ABSOLUTELY NO HELP, it seemed almost impossible to get any
information out of the person I spoke to (company policy
according to him.)
I this the right chip? Any ideas what is wrong?

Thanks, Denis Sevee <dsevee@cam.org>

If you have TOS 1.4 or greater, and if you did a standard format (80 track, 9 sec/track, non-twisted, as from the desktop), then they should work. I personally use a program called ps2form.tos from atari.archive.umich.edu, and it has never failed. If you have disks that you would rather not recopy, you might try using DC Format to rewrite the bootsectors.

Ps2form has been 100% reliable for me for years. The floppies even work in some NEC PCs I have that don't read disk formatted on other PCs!

Hi,

After setting up UUCP (still working on Hermes) and Binkley (I found the FAST_SER CPX and prg) I'd like to get QFAX working too. All it does so far is dialing and connecting to a remote fax, but somehow it doesn't seem to respond to the remote handshake. It all works fine with the appropriate beeps and all, but when it comes down to business my modem just hangs up.. Does anyone have any idea how to encourage the thing into less shameful behaviour? (it's a TKR 14k4 faxmodem with normal 9600 CL2 fax)

thanks in advance,

Paul

I posted this on comp.sys.atari.st, but got no answer.
A friend of mine told me that messy-DOS machines can not access more
than 1GB of SCSI disk at a time. If they are given a 2GB disk, they can
only use half of it.

Does this hold for Falcons too, or is AHDI 6.061 smart enough to handle them?
What about ICD pro?

From: benkeen@aol.com
Message-ID: <2mfs0e$ec2@search01.news.aol.com>
Source record: 33714

I've gotten into about 15 Falcons so far.. Anyhow, he're's how I did it:

First take out the 7 gold screws on the underside of the case. There will be one under a tamperproof seal. Do not take out any silver screws; they hold the floppy mount and the motherboard.

Next, what I do is put tape over the <countersunk> holes that the screws are in (after I have throughly loosened them) so I don't have to worry about loosing any when I take the top off.

Get the top of the case off and disconnect the keyboard. It is connected on the right. The bundle of wires may be glued to the case; just cut through the band of glue with scissors.

Once you've got the keyboard off, take out the dozen or so sheet metal screws and untwist the metal tabs that hold the main piece of the RF shield down. Don't forget the three on the back of the power supply near the switch. Disconnect the speaker connector and slide the shield off.

Unscrew the three screws and unbend the tab holding down the shield over the floppy drive.

Take out the remaining screws that hold down the rest of the RF shield. The socket for the co-processor will be underneath the keyboard, obscured by the last piece of the RF shield. Normally you don't have to take this off to install a HD or a card or memory.

To get back to normal, reverse the steps. Just make sure that when you reconnect the keyboard that you line it up with the bottom of the wires that the connector fits with. There are more wires coming off the board that go into the connector.

Feel free to e-mail me for clarification.

Benjamin Keen<benkeen@aol.com>

> I believe ICDs 'AdSCSI ST' series are along the same lines.

Sounds to me like the controller is the Xebec S1410 SASI -> ST506 card.
My first ST hard-drive was controlled by one of these which I got
from cannibalising an old computer. I ended up having to write the
driver for it since, at the time, no other drivers could talk to it
properly. (The SASI command block needed the step-rate written as the
last byte of the command)

All I remember was the transfer speed being _real_ slow; in the order of
~100K/s !!! Anyway, after a few years I bought the ICD ADSCSI+, (having
been using a homemade DMA->SCSI board) by then the ICD driver could
handle the Xebec and THE ADSCSI+ WAS COMPATIBLE WITH IT. The SASI bus
is pin-for-pin and just about electrically compatible with SCSI so
there is no problem.

Anyway, by the sounds of it you need to check all the connections to
your drive in the box. As Brian Robson mentioned, sounds like you've
got some faulty power connection.

Cheers, Steve

PS. I dumped the Xebec a few years ago for a Maxtor with native SCSI!
The difference between 100K/s and 1M/s is beyond belief!

You found the internal bus connector, which can be used for graphics cards.
To install an internal SCSI hard drive in a MegaST, you will need an ICD
ADSCSI Micro host adaptor. These cost about $70, if memory serves.
Installation is fairly trivial. Call Toad Computers (1-800-448-TOAD) or
D&P Computer Supply (1-800-535-4290) for advise and current pricing. Be
sure to specify that you want internal installation, as there are several
ICD ADSCSI host adaptor models.

Well, I have been using Flash 1.6 with our school's VAX, and have only found a couple of quirks with the VT100 emulation which are simply limitations of the program (Bold and Blinking characters show up as inverse). Flash 2 looks very promising in that respect as well. I had a major problem with the VT emulations on our VAX running VMS when DEC_CRT is set (the default), but I passed these on to John Trausholdt, and they should be fixed. I expect to be upgrading to Flash 2 soon.

You got two answers:

Thread (Any limit on size of Falcon SCSI discs?)

0 [13] Grabnar Matija (matija@sirius.ijs.si)
1 [16] Waldi Ravens (walra@moacs11)
2 [31] Kim Andersen (kim@dksoft.ping.dk)

> A friend of mine told me that messy-DOS machines can not access more
> than 1GB of SCSI disk at a time. If they are given a 2GB disk, they can
> only use half of it.

That may be true for MS-DOS machines, but not for the FALCON.

> Does this hold for Falcons too, or is AHDI 6.061 smart enough to handle them?

Maybe HDX has problems in formatting very large hard disks, but AHDI
will work fine. I would never use HDX to format and partition my hard
disk, because it's not possible to optimize the cluster size. This is
a waste of space, especially on large partitions (say, >= 64 MB).

> What about ICD pro?

I use the ICD software on my 1040ST because I have the ICD+
hostadaptor there. I don't like this software - they used their own
partition-scheme until 6.2.x, so disks with more than four partitions
partitioned with older software aren't readable by any AHDI 3.0
compatible drivers (HuSHI, HDDRIVER). Since 6.2.x it's possible to
partition AHDI 3.0 compatible, but it's not the default.
The ICD software also does not support XHDI which would be very useful
if you decide to use Minix-FS or any other software that accesses your
hard disk directly and wants to lock the device while doing so (e.g.
mfsdefrg).

I recommend HuSHI (comes with SCSI-Tool, commercial, author is Julian
Reschke - the author of the 'Profibuch') or HDDRIVER (comes with
Outside 3 (virtual memory for FALCON/TT), Diskus (disk editor and much
more) or 'standalone', commercial, author is Uwe Seimet). Both work
fine with FALCONs internal IDE drive and external SCSI drives. Both
have full XHDI support.

Bye,
Knarf

Hi,

I bought an Atari to SCART cable, and it's giving me problems.
Can anybody please help me to figure this out? The puzzle is this:

1 Plugged into my Philips TV, I get an empty screen, but it is synced properly.
The picture is VERY VERY faintly visible when I turn the brightness
completely up.

2 Same result when I put the SCART plug into my Akai VCR.

3 I can get a B/W picture when I connect one of the color pins
(7, 11, 15) with the 'Video in' pin (20). So, there seems to be nothing
principally wrong with syncing or the color signals.

4 There are resistors in the SCART plug before the color pins. Bypassing
these solves nothing.

5 SCART's 'video in' (pin 20) is connected Atari's 'composite sync' (pin 2).

6 In a magazine I read that for some Philips TVs, SCART's video in pin 20
should be connected to both Atari's pins 9 and 12 (hor & vert sync, resp.)
Might this help in my case?

Thanks very much for any information/pointers!

Bye,
Maarten

P.S. What are some good colorful games to start with? Is there
anything good on the atari archive?

] A Dealer here N.Z. brought a Falcon from the UK. has built in
] Speedo/Works, and the later TOS 4.04...

The machine in question is/was not a standard public model, it was packaged as a dealer model. It was also bought about 4-5 months ago, so the situation is not likely to be the same!

] But no manuals, he has been told from the firm, ? in the U.K.
] that there is still no Manuals...

A lot of the Falcons were shipped without manuals, and supposedly you could send your registration card to Atari and they would send you the manuals when they were ready.

]He did not tell me what manuals that were missing, but this does not
]help in selling Atari Falcons here...!!!

As there are probably less than 50 people in the country that know of them, and even less that know that this non-chain store is selling them, then I don't think manuals would make much difference!

Also, the people that would know of them, are pretty much only Atari-users, and should be able to work out how most of the (very simple) programs work!

Blame Atari on that one - if the built-in system was written with optimization in mind, there wouldn't be any need for Warp9/NVDI, etc. Those programs use official "GEM" programming, so they are limited by GEM (or GEM enhancements) but should also stay compatible with any future upgrades, graphics cards, etc. Some programs that are written with optimization (such as Uniterm, which BTW is an excellent program in its own right) work fine in the modes they are written for, but then are limited by just those things as well. It's pretty much "which limitations do you want to work with?"

These term programs aside, I'd use Warp9 (or NVDI) regardless as the speed increase shows up in almost everything...

>How much _is_ NVDI these days, and who sells it that can be accessed
>by the outside world?

Not sure (it's a bit pricey at least) - in the U.S. you could probably get it from Toad Computers, etc. Not sure outside the U.S...

Warp9's been working fine for me, so I haven't found a need to swich over as of yet...

From: sdssoft@delphi.com
Message-ID: <ZsyPofv.sdssoft@delphi.com>
Source record: 33723

The environment variables have nothing to do with the location of the system clipboard directory. There is an OS call scrp_read() and scrp_write() that are meant to manipulate this. The default action of a process that wants to use the clipboard is to scrp_read() to find it. If none has been installed, it should create a directory and then use scrp_write() to acknowledfge
that it has done so. MasterBrowse and Everest apparently do not follow the rules. You should point the program authors to the Compendium or the article I wrote about the Clipboard in Atari Explorer. Hope this helps.

Source record: 33724

When the AES goes to change resolutions, it sends AP_TERM to every running AES application and waits two seconds. It essentially gives apps two seconds to fail. This is probably a bad way to handle it but it's better than nothing.

Please don't take this as gospel because this might be bad later on but you might try sending AP_TFAIL immediately, and then if the user confirms a save (or doesn't), resart the res change yourself (and set a flag to not run through your confirmation process again.

> > Can I persuade GNU C to compile ANSI C sources ?

>Ummmm........if I recall correctly, you pass it the -ansi flag on the command
>line.

-ansi
This turns off certain features of GNU C that are in-
compatible with ANSI C, such as the asm, inline and
typeof keywords, and predefined macros such as unix and
vax that identify the type of system you are using. It
also enables the undesirable and rarely used ANSI tri-
graph feature, and disallows `$' as part of identif-
iers.

The `-ansi' option does not cause non-ANSI programs to
be rejected gratuitously. For that, `-pedantic' is re-
quired in addition to `-ansi'.

>reformating the drive, butI get a message "Hard Disk Error! Class 3 : Code 25 :
>Address 0". Does anybody have any idea what happened to the drive and how I
>can fix it?

Class 3 is an 'Non-recovered media error', basically a bad block. In this
case, it's block 0 which is your boot sector. Looking at my SCSI docs.,
I believe Code 25 is 'Defect List Error', which could mean that your
drive's list of bad blocks is corrupted. In this case, I can't really
suggest anything. It is possible, in some cases, to tell the drive to
re-initialise its defect list, but doing so is a bad idea since you
might also erase the factory defect list. So, it would appear your drive
is toasted. Unless anyone else has any suggestions....

Cheers, Steve

1500. Help! Gcc float/double problem!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-21 03:01:58 UTC
From: chanck@tartarus.uwa.edu.au
Message-ID: <2mj2n6$grc@styx.uwa.edu.au>
Source record: 33737

Hello,

I am having problems using GCC 2.5.3 with the data types Float and
Double. Whenever I declare a variable as float with 2 decimal places,
I always get an Address Error on compilation. For example:

```
float pi = 3.14;
float radius = 2.55;

main()
{
printf("Area = %.2f",pi*radius*radius)
}
```

will give me (gcc-cc1) : Address Error ...

When I use 3 decimal places or more this problem doesn't appear. Eg

```
float pi = 3.141;
float radius = 2.550;
```

Anyone encounter the same problem as this? I am using GCC 2.5.3 with
mntlib44, mntolb44. Help! it is fustrating.

regards
chanck@tartarus.uwa.edu.au

> over as of yet...

It is about $100, with shipping and all. The big difference between
Warp9 and NVDI is the acceleration of GEM graphics. Warp9 does very little,
NVDI does a whole lot. I own both, and can honestly say that NVDI is worth
the extra money even if you have already bought Warp9. It is excellent!
A significant feature of NVDI is that it includes a highly optimized GDOS.
Having GDOS around all the time is very nice (surprisingly, at least to me).

1503. MegaSTE GST Shifter upgrade (help!)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-21 05:50:42 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2mjcji$dmj@mailer.fsu.edu>
Source record: 33727
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, early MegaSTEs had a problem with their GST Shifter chips, that would cause crackling on DMA sound and a mono screen wrap problem. The fix is to install a GST Shifter chip later than rev D. I have such a MegaSTE, and am trying to perform this upgrade.

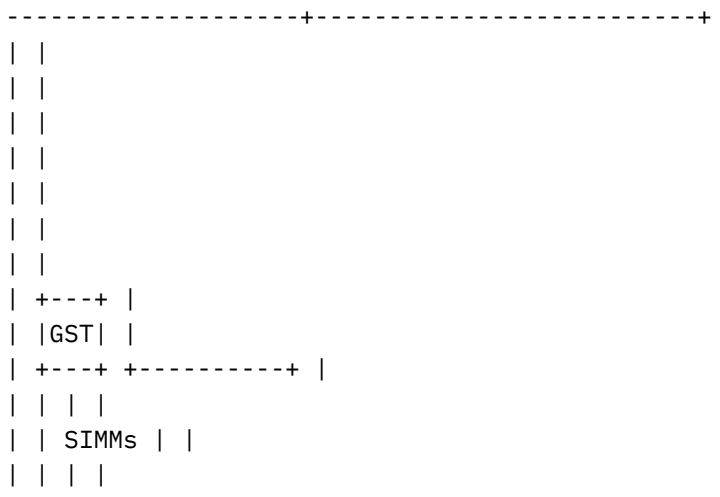
I called Best Electronics, and was a bit disappointed with the answer. Basically, they have some GST shifters, but they don't know when they were made (or what revision). They suggested that I write down all the markings on mine and call back with a description. Basically, I am hoping that I can precisely identify what chip I want, so I can call back and ask if they have any. So, I basically want to know what the markings are on the "good" chips.

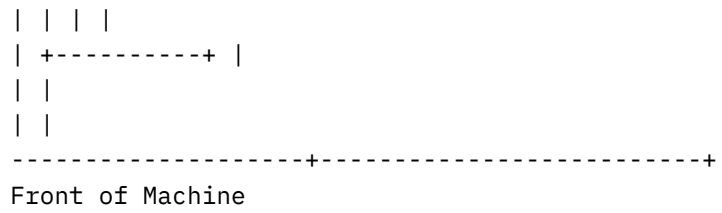
Thus, I have two questions:

1. Would someone (or several someones) who own MegaSTEs be so kind as to tell me what the markings on your GST Shifter chips say? My markings, and a description of how to find it are below (you can see it by simply lifting the hard disk cover section, complete disassembly is not necessary).

2. Does anyone have an alternate source for Atari chips? From other posts, I get the impression that some European countries have more responsive Atari branches than the one in the US (which currently seems to be totally engrossed with the Jaguar).

Ok, when viewed from the front of the machine, the GST Shifter is the largest PLCC chip you will be able to see with just the hard disk cover removed. It is right next to the upper left hand corner of the SIMM slots. The writing will be upside-down. PLCC's are the square ones with the loop-like pins on the sides, in sockets.





Front of Machine

Here is what is written on mine (rightside up):

9101 AMB
C301712-001
c Atari 1990
-31160608-01

1504. Getting GCC Up & Running

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-21 08:20:47 UTC
From: steve-j@teleport.com
Message-ID: <2mjlcv$p3@kelly.teleport.com>
Source record: 33728

Something that would be REALLY nice for GCC would be if someone kept an updated archive of EVERYTHING needed for it in one archive on atari.archive.umich.edu. That way, people wouldn't have to go searching around for 20+ seperate files. Anyone up to it???

I have my own C compilers and don't need GCC myself, but am asking this on behalf of several others who can't get GCC up and running. It would be A LOT easier for people to use GCC if there were an easily installed 'package' (complete with shell and all!) for it.

Wrong. LineA *is* still used even in TOS 3.06. You are confusing it
with Line*F*, which indeed is reserved by motorola (for coprocessors),
and is no longer used as of TOS 1.6, but TOS 1.4 (i.e. the AES) still
uses it.

I heard (from gawd knows where..!) that the 010 had been optimised and had
faster chip-code - I think that is the name for it, but basically the 'software'
on the chip was more efficient.

ICD did make a Kit to fit a Low Power 3 1/2 SCSI hard drive inside the Mega, this I have done, I am using a Quantum LPS 240, I think it draws only about 6 Watts..

ICD was doing a clear out sale (1993) for these host adapters called, AdSCSI Micro ST.

I think they went for about $39us, there is two problems with them, they don't support Parity and it stuffs up the external hard drive feature, so that you can only use the later ICD Host Adapters with it, so if you have a Atari external hard drive, it will not work...

The other way is to fit your drive in a Box and get a AdSCSI Host adapter, or a LINK host adapter all made by ICD....

To me there is no other way.....

You are correct. This is a bug in TOS 1.4 - 2.06 (and maybe even later
versions). You can correct it by using a program called GEMRam to load
the OS into memory, and then apply a patching program. Unfortunately, this
would probably take more memory than you would rather devote for a Mega2.

This also happens in high res, BTW. Not sure about medium.

From: teh@unix.brighton.ac.uk
Message-ID: <1994Mar21.201304.1867@unix.brighton.ac.uk>
Source record: 33895

I need a help to be able to communicate with DSP programs from within a C program (i'm using lattice C 5.6).

What I need is an example C program that will load and run a DSP program and then pass data to it and read data from it.

Corresponding DSP source would also be nice.

Please help!!

Thomas.

This might be fixed by expanding the transmit and receive buffers with
HSMODA02. You will have to use setter.ttp to play with the settings (though
the defaults are bigger than TOS's, so they might work).

This is correct to my knowledge. However, some applications do use
environment variables for this.
Everest follows the correct procedure up to a point. If it fails to locate
the system clipboard to does not install one.

I have a few qustions that are probably extremely
common. If there is an FAQ, and it answers my
questions, please just mail it to me.

1. I want to upgrade my 2Mb Mega ST to 4Mb. What
kind of SIMM's should I buy, and are there any special
instructions that I must follow to make it work?
Does anybody have a favorite place from which they buy
SIMM's, or can I just get them from JameCo?

2. I would also like to upgrade to TOS 1.4. Where can
I get the ROM's, and how much do they cost? Any special
concerns here?

3. Is there a C++ development system for the ST? Where
can I buy it? I have Gnu g++, and have almost got it
running, but would like a more up-to-date version of the
language than is available on atari.archive. The ideal
C++ development system would be very well connected to
Thanks,
Paul Stoaks

>Let me know if you're interested.

I've never seen documentation about how ICD handles class 2 commands. Anyway: there are well known workarounds which allow for class 2 commands on most host adapters, and of course our CD ROM software (available from Hard&Soft) uses them :-)

1522. NeoDesk 4.0

Is it possible to connect an IBM and a ST peer to peer. Like through the
serial port or through the MIDI port to my Soundblaster?
If so, what software is there that will support this connection?
Specifically what I want to do is use the Atari ST with it's SLM804 as
a print server so that I can print from the IBM to the SLM804.

Is this possible, and if so what do I need.

Thanks
SCott

Some TV's require a voltage on one of the SCART Pins to turn on the SCART, a Philips TV here had a small button next to the SCART connector, so if you don't provide that voltage the button will do it for you..

NOTE: some of the later TV's have the SCART switching on the remote...

I don't have the data handy on the SCART pin, but some later Ataries put out 12 volts on pin 8 of the monitor connector...

The resitors are there so that the Atari does not overload the SCART inputs, normal Video inputs are 0.75 volts, the Atari is 1.0 volts...

>uses it.

The AES does not use LineA functions. Only the LineA INIT function is
sometimes called (every time you move the pointer into the menu bar),
none of the other LineA functions is used. This 'feature' was also removed
in newer TOS versions.

If you dont believe me, just use SysMon, enable tracing for LineA and just
enable TOS and GEM tracing. SysMon will now trace all LineA calls just
from the OS. Work as usual with your computer... and all you will find
in the tracer output is the LineA-INIT call.

Older speedo versions use LineA, which is one reason for problems under
multitasking systems (Speedo 4.2 does no longer use LineA...).

Your statement about LineF is correct, TOS 1.4 was the last TOS that used
it for calling AES internal functions. It was implemented to shrink the
size of the AES code, since whole OS would not have fit into 196 K rom size.
The later TOS versions are 256 K long (and the OS had to move to $00E00000,
since there were only 196 K starting from $00FC0000 :-)

Greetings, Karsten

>faster chip-code - I think that is the name for it, but basically the 'software'
>on the chip was more efficient.

There are one or two notable optimizations in the microcode. The integer multiply and divide are a little faster, and there is a 3-instruction on-chip cache that can be used to speed up certain looping operations. Most people have observed about a 10% speedup going from 68000 to 68010. I'm not sure if the incompatibilties are worth the gain. (Exception handling is different, requiring you to run TOS 2.06. I don't recall if TOS 2.06 fixes the move sr privilege violation to allow older code to continue running, or if you have to patch that separately. In my experience, Gauntlet II stopped working after I upgraded my STe from TOS 1.62 to TOS 2.06, and that was reason enough to go back.)

I dunno; if you're interested in virtual-machine capabilities, you might as well go all the way to a 68030. If not, a fast 68000 with cache will give you more performance gain. (Although, the difference in multiply speed was pretty noticable... A 16 MHz 68010 would be nicest, in that case.)

1527. Host Adapters & software

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-22 09:17:54 UTC
From: gigxr01@nt.com

Source record: 33908

I am looking for a new host adapter/software setup for my STFM.
I have considered the following:

(i) Get ICD Pro Utilities & use my existing Supra adapter, but will
ICD s/ware work with supra & how good is this stuff anyway?

(ii) Get new ICD adapter + s/ware, which model is best (not link).

(iii) The Translator from Germany looks good, any comments?
It supports XHDI, what advantages does this give over ICD?

I would be interested in any comments from existing users.
Thanks in advance

You are right. But AFAIK even the VDI always called the LineA functions directly, never through $a00x, the opcodes were only provided for the programmer to bypass the slow VDI trap. Of course, v_gtext was always faster than calling Txtblt for every character... Anyway, everybody should forget about LineA as soon as possible :-)

Suppose you need to write directly to the screen (VDI is not reentrant and can not be called from an interrupt for example). How do you find the number of bytes per line (say if you have some fancy bloup/virtual screen mode) without inspecting the lineA variables?

Also is there anyway of getting at the ROM system fonts other than than through lineA?

Also what should AUTO folder TSRs do when they need screen info (dimensions, planes)?

I don't like lineA but I need a workable alternative before I stop using it.

Line-*F* was reserved. Line-*F* was used by the *AES* until TOS 2.xx. The VDI
never called Line-A directly; Line-A was just another external interface to
some lowlevel functions of the VDI screen driver in the ROMs.

1532. annoying Falcon incompatibility

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-22 11:33:01 UTC
From: steve@snark.cs.city.ac.uk
Message-ID: <2mml1d$8p6@bambam.cs.city.ac.uk>
Source record: 33913

When I first got my Falcon I noticed the following problem with a couple of programs (Risk & Concerto):

After loading a file, the area of the screen under the file selector would be repainted with the appropriate stuff (the Risk map or the Concerto transport display). There would then be a pause and the same area would be repainted with the GEM background color.

This effectively makes these programs unusable on the Falcon as neither has anyway of allowing the user force a full screen redraw.
This problem did not of couse affect my STe.

I've recent figured out what the problem is:

Both of these programs write to the background window directly; they don't install a new desktop. Now when they call the file selector they do so with the wind_update() semaphore set. For some reason on the Falcon, the file selector behaves as normal, but the redraw message it sends to GEM to repaint the background gets held up by the semaphore.
After these programs have loaded the file, they then redraw their background stuff and only then release the semaphore, where upon GEM repaints the same area with the background color the next time it gets control of the machine (usually in an evnt_multi()).

Incidently the same problen can also affect the tidying up after a dialog box but I get fewer people make the mistake of grabbing the wind_update() semaphore before doing a dialog.

So the moral of this tale is: Be Very Careful Where You Grab The Screen Semaphore. Typically you only need it if you walking the window tree or implementing your own form_do().

Incidently is there any way of making the Falcon AES ignore the semaphore when clearing up after a dialog box so as to make binary only programs that have this bug usable on the Falcon?

Funnily enough, I have an Atari to SCART lead which, when plugged into my TV works OK, but when my father plugs it into his, it doesn't. We tested all connections on the lead, and opened both TVs.

My TV uses the RGB connections, which is what the lead was wired for (along with the same resistors you talk about). However, his TV does not have the RGB capability, but uses composite video instead. When he discovered that, he proceeded to make up a new lead, using composite video only.

I'm not sure of the pin connections, but I can find out when I go home tonight. When he finished, it worked OK.

From: steve@snark.cs.city.ac.uk
Message-ID: <2mmm3d$8p6@bambam.cs.city.ac.uk>
Source record: 33915

I'd like to know what memory format (interleaved bit plane, separate bit plane, byte chunky, work chunky...) various 3rd party graphics cards use and how to identify them.

I'm writing a magnifying glass function for my GEM library and while I'm using VDI calls rather than accessing the screen directly, I need to perform the scaling directly on the system dependant data - translating the copied form into GEM standard format, scaling it and then translating it back is too slow.

BTW it is possible to do a 64x64 pixel magnifying glass in real time at 640x480x16 with NVDI! I might even manage 640x480x256 once I persuade gcc to optimize the scaling code the way I want it.

I think you're running out of memory. I had the same problems with Bash & Tcsh.
If gcc can't load gcc-cc1 (1 Mb.) it returns *without* an error message.

On my 4Mb. 1040ST I have to disable GEM & disk cache and use a small shell
in order to compile MiNT and the libaries.

Hope this helps.

Hmm, I tried this and it worked fine:

/home/knarf/prog> more float.c
main()
{
float pi = 3.14;
float radius = 2.55;

printf("Area = %.2f\n",pi*radius*radius);
}

/home/knarf/prog> gcc -o float float.c
/home/knarf/prog> float
Area = 20.42

> Anyone encounter the same problem as this? I am using GCC 2.5.3 with
> mntlib44, mntolb44. Help! it is fustrating.

Hmm, gcc 2.5.[0-7] is not recommended for the 68000 machines. I use
gcc 2.5.8 with MiNT library PL 44.

Bye,
Knarf

Crikey! Using Lattice 5.6 I just loaded the .prj file and hit build all and away it went. I had all my usual deskaccs & auto stuff so I guess I had about 2Mb free (on a Falcon). That GNU compiler sure does eat RAM! This was MiNT 1.10 BTW.

> So, how does scrp_read know where the clipboard is?

If a previously running program has set the path to the clipboard with scrp_write(), than scrp_read() will set that path and return a value >= 0, otherwise scrp_read() will return -1.

> Does the programmer need to worry about the position at all?

Yes the programmer should always verify that the path returned by scrp_read() exists, is writeable and readable; the AES does no checks at all! If something is wrong with the path returned by scrp_resd() or scrp_read() returned -1, than the program is on its own ;-).

A reasonable strategy would be:

1. Look for an environment variable SCRAPDIR or CLIPBOARD, if either of those exists and contains a valid and useable (i.e. writable and readable) path, than that should be used after it has been reported to the AES with scrp_write().

2. Use an existing folder \CLIPBRD on the boot device, if necessary try to create one, and of course verify that it can be written-to/read-from. If successful use scrp_write() to register this path.

3. Same as 2. with a path C:\CLIPBRD (or A:\CLIPBRD).

4. If all previous steps fail the program should not use the clipboard.

Note that this procedure is likely to create a big mess in a multitasking environment. It's best if the user installs a CPX that sets the clipboard path at boot time.

>
>On my 4Mb. 1040ST I have to disable GEM & disk cache and use a small shell
>in order to compile MiNT and the libaries.

On my 4meg MegaSTe, I pretty much disable everything except for
Edhak, Timedrv2 (so I can tell exactly where GCC is doing its stuff) and
one or two other things. I boot to the desktop, and use Toswin to
load TCSh 6.xx. It all depends on what's eating memory the most...

Anyways, one other suggestion to the original questioner is to stick
a "-v" parameter on the command line (i.e. "gcc -v -o hello hello.c").
This way he can see almost everything that's going on (including
what is being loaded and what's not)...

And a repeat from above - if you're in Mono mode, boot up with
TimeDrv2 in your AUTO folder - it displays the time and also every
disk access (read and write). This gives me that "warm fuzzy feeling"
as I can see that something is actually going on, and specifically
where it is going on (for instance, that it is indeed using the partition
that I designated for TeMPorary files)...

Finally, a little off the above subject, but I had posted a message
some time back about GCC not being able to find the GEM library even
though I was using the -lgem (and -mshort) parameters - I figured
out where I goofed. I was putting the -lgem *before* the stuff to
be compiled, as so:

gcc -v -lgem16 -mshort -o test.ttp test.c

However, when I stuck the parameters at the end, it worked, as so:

gcc -v -o test.ttp test.c -lgem16 -mshort

Computers can be *so* picky sometimes :-)

>So, how does scrp_read know where the clipboard is? Does the
>programmer need to worry about the position at all?

scrp_read() returns the value last given to scrp_write(), which defaults (on boot) to an empty string. There is a little CPX around which takes care of reinitialising the scrap directory every boot, as well as also being able to view the scrap file. There should be a copy at a.a (clipcpx.lzh perhaps?)

Yes, the programmer does have to worry -- if scrp_read returns something that isn't suitable, there is a little algorithm (included in the Compendium) to generate some directory on an appropriate device. IIRC, it is usually \\CLIPBRD on the boot drive.

Source record: 33926

As far as I know this "double click" problem affects all current versions of TOS (i.e. versions 1.6 thru 4.04 on my Falcon)

However, the fix is VERY simple!

There exists a desk accessory called ButtonFixer by Charles F. johnson of CodeHead software that slows down the system's handling of mouse clicks. The acc is Freeware and should be available via ST specific BBS or FTP sites.

Also, the acc is very small (less than 2 kb in size). This is a far better solution than using GEMram to copy the TOS ROMS to RAM and waste 512kb of your precious memory. These type of programs are for other purposes like for TOS extentions like WINX, etc.

Hope this helps!

The latest word I've heard is that NeoDesk 4.0 will be a BIG step up
from 3 and will have lots of funky Geneva-aware features. Don't ask
me WHAT exactly 'cause I don't know!

As for when, the word on GEnie is 3 to 4 weeks.

Also, the upgrade for 3.x to 4.0 will be $25 plus sending in your old
disks plus shipping (?).

.s.

1548. ** Triple Yahoo game uploaded to a.a.u.e!!! ***

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-22 23:23:29 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar22.232329.14144@beaver.cs.washington.edu>
Source record: 33929
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Triple Yahoo version 1.0, a new one to four player yahtzee dice cloan by Stuart Denman, was just uploaded to atari.archive.umich.edu. It is in Games and Falcon directories.

This addicting new game works on ALL atari computers in ANY resolution with ANY system setup, even graphics cards! The game uses over 130K of digitized DMA sound as well as all the perks of the new AES systems. It supports Speedo GDOS fonts, 3D buttons, color icons, and runs under MultiTOS or Geneva.

Everything is 100% GEM and runs in windows. The game is highly configurable from the color of the windows, to the type of dice you have. All with impressive sound effects and computer "comments" on your rolls.

This is a shareware demo version from StuSoft, so if you like it, you can register and avoid the shareware reminders. Please read the file TRIYAHOO.DOC included with the game for all information about registering, how to play the game, and info about all the different preferences.

Enjoy, I think this is the best game I've seen on the Ataris in a LONG time! Comments are welcome, let me know what you think!

1549. SURVEY RESULTS: GEM libraries

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-23 00:39:25 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2mo33t$qne@uqcspe.cs.uq.oz.au>
Source record: 33932

13 responses, 9.5 of which are using a GEM library.

Thanks to all respondants.

The libraries mentioned in the survey responses were:

Library name	Distribution	Author
Enhanced GEM	Freeware	Christian_Grunenberg@s2.maus.de
FLUID	Not yet	Steve Sowerby (sms@sys.uea.ac.uk)
GEM++	GPLed Freeware	Warwick Allison (warwick@cs.uq.oz.au)
Gemlib	Freeware	Jwahar Bammi (bammi@cadence.com)
HGT (HiSoft BASIC	Commercial	Dave Nutkins and Ofir Gal
GEM Toolkit)		(hisoft@cix.compulink.co.uk)
Steve Woodford's	Personal use	Steve Woodford (woodford@esca.com)
Prospero C library	Commercial	?? Does Prospero still exist ??
WinLIB PRO	Commercial	Karl 0ygard (karlo@ifi.uio.no)
		Ken Hollis (khollis@bitsink.gbdata.com)
		Markus Gutschke (gutschk@uni-muenster.de)
Wndhndlr	Available	Jan Kim (kim@vax.mpiz-koeln.mpg.d400.de)

The major features respondants like are:

- easy to use with their compiler and language
- amodal dialogues
- general purpose windows
- window menus
- toolbars
- popups
- easy to use / simple to understand
- comes with demo software
- free
- it doesn't enforce event driven programming (uses callbacks)
- apps only have to supply the actual redrawing code an
a function called when the closer is clicked.
- checkboxes
- lists
- scrollbars
- multi-dialog (Multi-dialog is a popup menu with an associated sub-dialog)
- hotkeys for buttons, boxchar's and checkboxes.
- enhanced editable text fields (with selection and clipboard use)
- sources are available, you can look in it
- a good example exists (sources)
- easy to patch (for strange functions)

(but of course, no library provides all of this)

The major problems respondants found with GEM libraries:

- incompatibilities between gem bindings in various compiler libaries
- don't want to use library without source code
- library needs to be properly maintained/improved with AES/VDI upgrades
- a text-editor widget would be nice
- the keyboard shortcuts use the Alt key, they should use the Ctrl key
- unfinished - lots to add yet
- requires slightly different programming from standard GEM (callbacks)
- not too AES-3D friendly in some instances
- no real documentation
- there is no documentation (not even in German)
- documentation in German
- some of the very useful features are still undocumented

Hmm... look at those last 4.

Below are the unsummarised responses. More in-depth comments and descriptions of the libraries appear therein.

HiSoft BASIC GEM Toolkit (HGT)
Dave Nutkins and Ofir Gal
hisoft@cix.compulink.co.uk
commercial
Amodal dialogues, general purpose windows, window menus, toolbars

Heck, I don't know the author. It's the one that came with Prospero C (and Prospero Pascal if I work on any of my older programs). I think Prospero is down the tubes though. They didn't respond to my last email.
Easy to use with my compiler.
I've had several problems where I've had to create my own data structures because the ones supplied with my program didn't like the data being passed to it by WERCS. Kept getting warnings of data type mismatch when there was none.

Which libraries are available for C programming (including source code)? I've seen some without source code, and I don't want to use them.

my own
me (Steve Woodford)
woodford@esca.com
[personal use only]
Maintainable 'in-house'. All 'tricks' completely understood (I wrote it!).
Lack of time to properly maintain/improve/incorporate AES/VDI upgrades.
Perhaps I should migrate to a 'standard' library.....
I await the results of this survey!

Anything to ease the task of GEM programming will be welcome. I've had a few attempts at programming for GEM but I still haven't got my head around it yet.

(Don't know which libraries are available / standard)

GEM++ Only one of it's kind. Easy to use. Comes with demo
software. Free.
gem don't have any other library to use. Simple to understand.

GEM++ A text-editor widget would be nice. Not sure whether I
can establish multiple objects (eg: buttons) on screen
from a single RSC-object. That'd be nice too.
gem No real docs (Tim Oren...)

Enhanced GEM
Christian Grunenberg
Christian_Grunenberg@s2.maus.de
pd (?)
It provides a decent set of new objects (popups, etc)
Documentation (there is none, even in German)
The keyboard shortcuts use the Alt key, they should use the Ctrl key
It is written in the Pure C AES dialect (ob_spec is a union), which
makes it harder to port to traditional AES dialects.

my own ("wndhndlr")
myself
kim@vax.mpiz-koeln.mpg.d400.de
anyone who cares may get the source from me
(no significant distribution so far)
* it doesn't enforce event driven programming
* my apps only have to supply the actual redrawing code an
a function called when the closer is clicked.
I have to track down bugs and add stuff myself...
I should say that my library isn't really a GEM library. It's (as
one may guess from the name "wndhndlr") just a window event
handler. It can handle most window related events in a more or
less sensible, more or less user configurable way, user code is
called back upon redraw events and upon closing a window.
I've never done any documentation or made any distribution of
this stuff, but a few friends have copies so they can build other
stuff I made using the wndhndlr lib.

FLUID (my own)
Steve Sowerby
sms@sys.uea.ac.uk
Not available yet :-(
Modeless/modal dialogs in windows
Extra dialog gadgets : checkboxes, popup menus, lists, scrollbars,
multi-dialog (Multi-dialog is a popup menu with an associated sub-dialog
- as in Myriad's Preferences dialog- which is fully automated)
Hotkeys for buttons, boxchar's and checkboxes.
Enhanced editable text fields (with selection and clipboard use)
Untested (by other than me)
Unfinished - lots to add yet.
- I've only written what I've needed for Myriad so far.
Requires slightly different programming from standard GEM (callbacks)

Not too AES-3D friendly in some instances
I couldn't decipher EGEM or get it to work with Lattice C without lots of hassles, I haven't got G++ installed so GEM++ is no good yet, and frankly there were a lot of things I wanted extra to anything I'd seen so I wrote my own. Generally the problem with enhanced GEM libraries is the lack of documentation and example programs. I hope to provide this if I ever release FLUID. I think if a few people got together and designed something properly (similar to MiNTlibs development), it would be possible to produce a REALLY good library that everyone could use, thus improving the general standard of GEM programs (which can sometimes be a bit poor). Maybe you and I should get together and look at each other's stuff and see what we can come up with ? I must admit I haven't looked at GEM++ for a while. I really do plan to install G++ RSN so I might send some comments your way then. I also would like to release FLUID at some point even if its just for people to get ideas from.

GEM++
C++ is SO MUCH BETTER than C for GUI programming (and apps programming in general). I also like how you did most of the work for useful classes already... ;-)
Some of the very useful classes are still undocumented.
I'm working on a simple, small class for mouse pointers; this grew out of an idea I had... I wanted to be able to define mouse pointer objects in the RSC file.
I used to use GEMfast, mostly because it had studly things like sprintf() into a dialog box... it made things easier in C. Since I got interested in C++, I've looked at Extended GEM and several other GEM libraries for C, but I've ditched them all because they're not a C++ class library; things are just so much easier in C++ it's unreal.

E_GEM (1.20 & 1.30)
Chistian Grunenberg
Christian_Grunenberg@s2.maus.de
freeware
Sources are available , you can look in it
A good example exists (sources) : WINLUPE
Easy to use , Easy to patch (for strange functions)
No documentation
German (but for French people German/English , it is always a foreign language)
I have not tried BIG (a french product) : They claimed once that it will be part of the developper kit but ???
It seems to be too BIG , too restrictive : too much is done by the library , it is not flexible at all...
(It is of course my personnal point of view)
No, I'm working on one, but for the record, YES.

WinLIB PRO (Version 0.63Alpha as of writing)
Karl 0ygard, Ken Hollis, Markus Gutschke
karlo@ifi.uio.no, khollis@bitsink.gbdata.com, gutschk@uni-muenster.de
Commercial (planned)

It combines all of the major elements of all other previously written
library IDEAS into one major library, with new ideas and updates.
Trying to get these damned bugs fixed!
If you would like to order the base system to WinLIB PRO, it will be
available for $19.95(US) (that's an unbeatable price on ANY system for a
MULTITASKING GUI) for users of Pure C, Laser C, Lattice C, GNU C++,
Alcyon C, Heat 'n Serve C, Mark Williams C, and Turbo C.

Hmm. I don't think memory is the problem. I have 4 megs of TT RAM and 4 megs of ST RAM,
so even with MiNT/Multitos loaded, there is still a fair amount to spare.

<stuff deleted>

|> Anyways, one other suggestion to the original questioner is to stick

|> This way he can see almost everything that's going on (including
|> what is being loaded and what's not)...
|>

Someone else also suggested the -v option to me. I've had very little spare time
lately, but I did manage to run a quick test. "gcc" calls up one of the gcc binaries (cpp
if
memory serves me well) with a bunch of parametres, but cpp never gets loaded and the
whole thing just returns to the shell prompt. Looks like I should re-check my gcc-related
environment variables. (They did seem OK the last time I checked.)

Thanks to all who responded.

1554. Using third party 720k/1.4 Meg drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-23 06:13:49 UTC
From: jbilger@cs.tamu.edu
Message-ID: <2mommt$j4s@news.tamu.edu>
Source record: 33937

My SF314 (atari double sided drive) just died. The major problem is
that ALL my disks are DS/DD. What third party disk drives will work on
the ST? What about the 1.4 Meg drives? I know I couldn't format at
1.4 Meg but would it work as a 720k drive?

Thanks

Noone bothered about reading the LineA variables. You cant get the bytes per
line nor the system font via VDI. Since LineA-INIT is supported even by
graphics cards without LineA-functions, this is no problem.

But calling the LineA-drawing functions will not always work, you can also
disable LineA functions (except LineA Init :-) when using NVDI.

Greetings, Karsten

Or use Uniterm.. that has VT100/VT102/VT220 and Tektronix T4010 emulation.
OK, it's not fully GEM complient and you can't have it in a window and it
only runs in ST-Med or ST-High modes, but it's the best terminal emulator
I've found on the ST/TT/Falcon, and believe me, I've tried them all!

Essentially any of them. Don't bother with a 1.44 or 2.88 unless you can
get it significantly faster (you get to decide what would be significant).

The big issue is whether you can install the bare drive (that's what you
want to buy) in the case you have, without having to do any cutting.

Suggest you take your old, dead drive in for comparison.

Also, the length of the drive may be a problem -- so take the cables
which attach directly to the drive, along as well. When I upgraded from
SS to DS on my original drive, the DS was about 1.5" shorter and there was
not any excess cable length -- so (on an external drive) I had some
real interesting arranging to do.

> Does anybody have a favorite place from which they buy
> SIMM's, or can I just get them from JameCo?

MegaSTs do not take SIMMs unless you use a memory board that happens to give you that feature. Other memory boards use only DRAMs. For memory upgrades, Rising Star claims to be the king (1-800-252-2787). Other companies that I have dealt with that could do it are D&P Computers (1-800-535-4290) and Toad Computers 1-800-448-TOAD). I can personally recommend D&P for hardware work.

Do yourself a favor and order a copy of Current Notes magazine when you call one of these places. The ads contained within will make your search a lot easier (not to mention the articles, reviews, PD library, etc.). It is the best stateside ST resource that I know about.

> 2. I would also like to upgrade to TOS 1.4. Where can
> I get the ROM's, and how much do they cost? Any special
> concerns here?

There are 2 chip and 6 chip sets, so you have to determine which type you need for your particular motherboard revision. Any of the companies mentioned above could walk you through the process on the phone. Rising Star lists a price of $49 to "add TOS 1.4" in the March 94 Current Notes. I presume that includes chips and labor.

I believe g++ is the only contender, but I was under the impression that the Atari ST ports of gcc/g++ were current.

I hear that the Supra host adaptor was not very complete, whereas the ICD
is quite general in terms of what it will work with.

> (ii) Get new ICD adapter + s/ware, which model is best (not link).

If you don't have an internal clock, the ADSCSI+. If you do, the ADSCSI.
Both of these support parity, which the Link does not (though the Link is
attractive for other reasons, like CDROM/Floptical compatibility).

I have an ADSCSI and an older "original" ICD host adaptor, they have been in
heavy use for years, and I have never had a problem. I really like their
software.

Rising Star computers have a drive repair/trade-in policy that seems quite economical. I cannot claim to have any experience with them, but they always have a fullpage ad in Current Notes. Their number is 1-800-252-2787.

Oh, when purchasing a floppy, I would be sure to use DC Maxtracks (from atari.archive.umich.edu) to check if it can write "extended" formats to your satisfaction. I would not buy a drive that could not handle at least 82 tracks, 10 sectors per track. In fact, I encounter 83/11 disks enough to make that very desireable. This should not be a problem, but it is easy to check with this program. Even if you do not use extended formats yourself, lots of game disks do.

I believe it is the default. From the gcc man page:

-m68881
Generate output containing 68881 instructions for
floating point. This is the default if you use the un-
modified sources.

The 68882 is pin compatible with the 68881 (only faster), so the default
library stuff should make use of it.

I managed to get gcc et al down to my Atari at home. Now, I'm wondering:

1) are there any non-MiNT shells that I can use with gcc and g++ and
2) what tools are people using to manage environment variables if these are not being handled inside the shell?

Thanks and have fun! - Bob

There's one thing that's been puzzling me recently, that is, how do you handle placing icons on the desktop (Calligrapher style) in a multitasking environment? It seems to me that you could end up in a sorry mess with drive icons beneath a program's printer icon!

It isn't a problem at all, because you never modify the desktop's desktop (if you follow), you only modify your own desktop. You log your own desktop with wind_set(WF_NEWDESK, ...); details in any competent ST language manual.

>It seems to me that you could end up in a sorry mess with drive icons
>beneath a program's printer icon!

MultiTOS (and hopefully Geneva et al) does the right thing, and swaps desktops when the AES switches applications (ie when the menu bar changes, approximately). But it does look confusing IMHO, when the Desktop's drive icons and so on, disappear from view.

Assuming that you want the compiled object code to use the 68882, you
simply add the option -m68881 on the command line. First you'll need to
recompile the mintlib with this (and the -m68030) option.

FE>far better solution than using GEMram to copy the TOS ROMS to RAM
FE>and waste 512kb of your precious memory. These type of programs
FE>are for other purposes like for TOS extentions like WINX, etc.

Buttonfix does not correct the bug completely: when scrolling by
holding down the mousebutton, scrolling will continue for some time
when releasing the mousebutton, thus overshooting the location where
you wanted to stop.
The combination gemram/arrowfix will correct the bug completely,
even allowing you to set the delaytime between de first and
subsequent scrolls (using the included cpx-module). This ofcourse
will use a relatively large amount of valuable RAM (200-something KB
with tos 2.06). Arrowfix can also be used without gemram, enabeling
only a partial fix (same as buttonfix, but as an auto-prg, not an
acc).
Winx also uses gemram (or similar prg), becouse is uses the same
principal: correcting/modifing tos itself, therefore needing a copy
of tos/gem in ram.
Using an eprom programmer one can write a copy of the corrected
tos in eprom, to replace the original rom's.
There should be a market for this: i would love a tos 2.06 with the
ramtest/hd-wait replaced by a routine that actually waits until the
hd tels it that it is ready, to name just one other thing.

I think it's a bad idea to install a desktop under MTOS, it makes the
program less multi-tasking friendly as the user has to reach for the menu
bar to activate other apps.

First check the motherboard of your Mega2 ST to see if it already has traces cut for an additional 2 Megs of RAM. I sent mine to TOAD Computers and they installed 2 Megs for about $150. Toad also has TOS 1.04 for $80 or so. I haven't upgraded to 1.04 but some have mentioned Hard Drive crashes so backing up is probably prudient prior to installation.

>Can someone please explain the difference between "Falcon bus modus"
>and "STE bus modus" as found in the NVRAM settings?

STE bus mode is more tolerant to faulty programming.

STEs don't bus error when absent memory locations are accessed, esp. when having less than 4 MB RAM and when accessing the Yamaha sound chip. The latter was mirrored to several locations in STs, and isn't in the Falcon.

Setting the F030 to STE bus mode will make it ignore programs accessing these locations instead of generating a bus error.

Source record: 33611

Yes, you are correct in that ButtonFix doesn't completely correct the
double-click bug in the newer TOSs. However, it and similar programs
do a reasonable job for most tastes and save a hell of a lot more
RAM to boot!

It all comes down to how much RAM you have and how sensative you are to this
relatively minor but annoying OS bug.

TOS 1.6 consumes 256kb of ROM while TOS 2.6 and up consume 512kb of ROM.
If you opt for GEMram, you will sacrifice this amount of RAM for your
respective version of the TOS. I ask you - unless you have very
specific uses for this program (i.e. WINX) wouldn't make sense to go with
the smaller and more efficent solution?

Ari

By the time the auto folder programs are executed the VDI is up and
running! It is the AES that is started after processing the auto
folder, *not* the VDI.

things like operating systems should be free. (although that might
create a bundle of weird flavors of the same OS ... like unix) .. but,
definitely having the source, etc of an OS is pretty handy...

as to the 68010, ... as I understand it, it also handles memory segmentation
faults better than the 68000 ... so that would benefit MiNT, or any other
multiprogramming OS...

IMO, this is how the standard should read. If there is no clipboard
installed, the user probably doesn't want to transfer data between
applications, and therefore the clipboard should be kept internal to
the program (if that would be more efficient).

Creating a file just to cut and paste 5 characters of text can be a
little annoying in Atari Workso, for example.

Almost. Rewite:

By the time the auto folder programs are executed *a* VDI is up and
running!

When my machine boots, it is first in TT-medium running the ROM VDI.
Shortly, the NOVA Emulator kicks in and its the NOVA VDI at one
resolution. Finally, the full NOVA VDI kicks in and the resolution
changes again.

All shells handle environment variables. But also, there is a program
called `environ' with goes in the AUTO folder and sets up an environment
string for the desktop. So in principle, you could run GCC.TTP from
the desktop (I've never tried, but I imagine it would be a little painful -
I don't even run it from the command line [I use Make])

It would be nice if there were a standard way for applications to commu-
nicate with the desktop (program). An application could pass objects
(icons) to the desktop, to display them. The desktop manages the objects
and sends a message to the appropriate application when the user selects
or activates an object. Upon termination the application tells the desk-
top that the objects can be removed.

Does such a standard already exist?

HOWFAST version 1.0..

Is this the latest version..??

Also can some one post the Info that is
on the screen, Translate it, Thanks.......

I just had a play with RateHD V3.07 and it gave me
1200k with my 240m Quantum LPS..

This was run from the DeskTop with very little TSR's
and No ACC running, I don't know if this helps..

I then run HOWFAST, but that gave me some 900k and
about 200k Writes...

I then had a play with the Options, Block Sizes, what ever,
it was then going up to 1000k read, I then uped these Block
settings, I was getting about 1100 Read, and then there was
a Dialog Box stating some thing, I think about Run out of Disk
space...

So Can some one do a little translation of the Mail Sceen
so that I know what all these Block options meen....??

Or better still a translation of the Doc's...

Thanks......

1591. Good Kermit Performance!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-24 05:00:02 UTC
From: mlehmann@austin.ibm.com
Message-ID: <Cn5KK3.2rtC@austin.ibm.com>
Source record: 33624

I finally learned how to make Kermit get drastically better performance.
One is to up the receive and send packet lengths, but the major way
is to borrow Z-modem's window concept.

To do the window concept, you must have a version of Kermimt that supports
it, C-Kermit. Anonymously ftp "ckser.ttp" from kermit.columbia.edu.

But, I can only get C-kermit to handle high speeds with MiNT 0.95, but when
I run C-kermit in a TOSWIN window, every packet ends up with a NAK.

Does anyone use Mint and KERMIT. Does it work well for you? Has anyone
recompiled C-Kermit for MiNT?

I would recompile it, but I don't know the GNU C directory structure. I
have the latest MiNT libraries but I don't know where to put them inside
my MiNT Distribution Kit structure. If some kind sole would help me get
my MiNT GNU C setup right, I would be glad to attempt the conversion.

> but later AES can as far as I know send some more messages.

I can't guarantee that this is truly a complete list of all GEM event messages, but it's all the ones that I know about, compiled from a variety of sources and checked against the latest reference (the Atari Compendium).

```
/****** GEM Event message definitions (comprehensive?) *****************/

#define MN_SELECTED 10

#define WM_REDRAW 20
#define WM_TOPPED 21
#define WM_CLOSED 22
#define WM_FULLED 23
#define WM_ARROWED 24
#define WM_HSLID 25
#define WM_VSLID 26
#define WM_SIZED 27
#define WM_MOVED 28
#define WM_NEWTOP 29

#define WM_UNTOPPED 30 /* AES 3.3+ (date?) */
#define WM_ONTOP 31 "

#define WM_BOTTOM 33 /* AES 4.1+ (Jun24/93) */
#define WM_ICONIFY 34 "
#define WM_UNICONIFY 35 "
#define WM_ALLICONIFY 36 "
#define WM_TOOLBAR 37 "

#define AC_OPEN 40
#define AC_CLOSE 41

#define CT_UPDATE 50 /* incompatible German messages? */
#define CT_MOVE 51 "
#define CT_NEWTOP 52 "

#define AP_TERM 50 /* AES 4.0+ (Jan21/93) */
#define AP_TFAIL 51 "
#define AP_RESCHG 57 "
```

```
#define SHUT_COMPLETED 60 "
#define RESCH_COMPLETED 61 "
#define AP_DRAGDROP 63 "
#define SH_WDRAW 72 "
#define CH_EXIT 80 "
```

Note that WM_NEWTOP has never been sent by any Atari AES that I'm aware of (although I believe it is supported under PC GEM). Also, the Compendium erroneously lists CH_EXIT as 90, and claims that WM_ONTOP and WM_UNTOPPED weren't released until AES 4.0.

As for what to do when you receive them, the Compendium is possibly the best publicly available resource, although the (confidential) developer docs do have more details. I thought the Compendium was too superficial in this important area.

Also, there is an extended set of system messages you may run into if you're running Gemini, or some Compo software, that use the XACC protocol for inter-application communications (sometimes also referred to as the VA protocol, for Venus <-> Accessory?). There's a document available at many ftp sites that fully describes XACC.

Keep in mind that if your application receives messages that it doesn't understand, the rule is that you're supposed to ignore them.

1595. What's new w/ORCS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-24 07:31:27 UTC
From: jbeeghly@u.washington.edu
Message-ID: <2mrfkf$bv9@news.u.washington.edu>
Source record: 33628

I really like useing the ORCS (Otto's Resource Construction Set) resource editor, but I have two problems:

1) It is very unstable. For example, I can get ORCS to crash if I take a dialog w/several objects and drag it to the desktop (to copy to other parts of the resource or to other files), the try to place it into another spot. This doesn't happen w/individual objects, just objects with several children.

I can also get it to bomb if I am using a RAM disk and edit bitmaps or icons.

2) It only suports the original version/format of resources, therefore it can not load in newer RSC files and it can not edit color icons. I absolutely MUST have the ability to edit color icons. I currently own Interface, which allows me to edit color icons and the newer version of RSC files, but to be quite honest, I kind of prefer ORCS over Interface.

I was wondering:
1) Is there a newer version of ORCS out there (I'm currently using ver 1.00)?
2) Does the author have an Internet e-mail addres?

No, I have not registered or sent in my shareware fee yet. I was waiting for a more stable version to be released, but I haven't seen any updates to the original 1.00 version. If the bugs get fixed, I'd gladly send in the fee.

Also, the problems that I have encountered occur on all atari platforms... from a 1040 ST w/TOS 1.0 to the newer Falcon models....

This does _not_ work with OverScanST, OverScanTT, Reflex-card or an older
Matrix color card.

>(these are abuses, but I'm just showing that you still don't need LineA
>for some abuses)

If you are writing a VideoTitler (like Overlay) you have to use Setscreen()
and therefore you need to know the bytes per line for the second (and third)
screenbuffer. The rest is done via standard VDI. If a card does not
support setscreen, vro_cpyfm() is used instead, but this is much slower
than page flipping.

The next generation of NVDI will offer VDI calls to allocate a second
screen and to switch between them. This will even work with external
graphics cards (like ET4000) that allow the change of the video adress.
There are also new calls to query the plane layout etc...

Greetings, Karsten

This is false. The physical VDI workstation is openend after the start
of the AES. Just have a look with SysMon.
If appl_init() fails (this is the official Atari auto-folder check) you
have to open a physical VDI screenworkstation. Afterwards you have to
close it again.

>point me in the right direction (ftp?).

I hope you realise that normal compression methods (zip, zoo, lharc, etc)
almost give you *no* gain when used on audio samples. In the past I've tried
to compress samples from my sampler, but the best I got (on some samples)
was some 80%. Typically 90-99%...
So you should be on the outlook for compression methods that are particularly
suited for use on sample-files.
I think that algorithms that use a kind of delta-compression might work. I
don't know if delta-comp is the right term; I mean a compression method that
doesn't compress the actual numeric values, but stores/compresses them as
offsets from the previous value. The problem with audio is that there's little
pattern-repeat in general, so little to compress. However, I wouldn't be
surprised if there _was_ a kind of 'regularity' in the differences between two
adjacent numbers (i.e. between sample(i) and sample(i+1)). Just a wild guess
though...

I use gulam under TOS on both ST & Falcon without problems. It fails under MultiTOS. It includes lots of built in unix style commands including setenv and doesn't take much memory which is important in 4 Meg since gcc does.

Zoo, including source, is available for ftp from many sites (although
I don't know whether the copyright holder would mind you nicking his/her
code, especially if it's for inclusion in your VoiceMail thingy for HiSoft).
The high-compression mode works well for `general' files, I can't
vouch for its effectiveness on audio data. Especially if you need
real-time (de)compression. Perhaps, as a Falcon user, you might find
something useful by looking in DSP books. Try contacting Motorola too,
they may have sample code libraries for the 56k.

Do you use DevPacDSP? I'm looking for some opinions on whether it's worth
getting.

Look in the comp.compression FAQ. It will give you some pointers to programs
that _try_ to compress audio data. (no sources though...) I say _try_
because audio data is extremely hard to compress, even with lossy algorithms,
compared to graphics. (Compare MPEG audio's 6:1 ratio to the often reached
15:1 ratio's on graphics...) If you don't want loss of information you
could try converting to 8-bit mu-law (which is a sort of compression more
or less...) or huffman encoding the differences between each pair of sample
values. But don't expect too high compression ratio's !!! (40%-60% at max.!)

This is a really fun game, and my $20 check is going out over the weekend :-)
It works on my Falcon with 800*600 (ScreenBlaster)!

Well - in that case, it's definitely a bug in those programs, and not in the
Falcon TOS.

Might it be that you are using TOS 4.04? I think the behaviour changed
somewhere between 4.02 and 4.04.

: I'm not sure of the pin connections, but I can find out when I go home
: tonight. When he finished, it worked OK.

As promised, here are the pin connections that were used to get the
composite video to get through properly.

Atari Monitor Port
==================

1 - Audio out
2 - Composite Video
3 - General purpose output
4 - Monochrome detect
5 - Audio in
6 - Green video
7 - Red video
8 - +12v pull up
9 - Horizontal sync
10 - Blue video
11 - Monochrome
12 - Vertical sync
13 - Ground

Scart Plug
==========

1 - Audio output B stereo right
2 - Audio input B stereo right
3 - Audio output A or mono
4 - Audio common return
5 - Blue video return
6 - Audio input A
7 - Blue video input
8 - Function switch
9 - Green video return
10 - Inter com data line N2
11 - Green video input

12 - Inter com data line N1
13 - Red video return
14 - Inter com data common return
15 - Red video input
16 - RGB blanking
17 - Composite video return
18 - RGB blanking return
19 - Composite video output
20 - Composite video input (or sync for RGB)

Pins to be connected
====================

Atari side SCART side
----
1 --------------- 6
2 --------------- 20
13 -------------- 17 & 4 (Common ground)

That's all that needed to be connected to get the Atari to work with
the TV with composite video capability.

In a way yes. An application can simply install a toolbox window on the
desktop and use WF_BEVENT so that it does not have to be topped each
time. That requires AES 4.xx or Winx.

You forgot one of the strong points under non-multitasking enviroment:
ue (a special version of Microemacs), which is an integral part of
Gulam -> ue can be 'suspended' with ^Z (in practice works just like ^Z
in Unix, although there is no multitasking) + commandline has full(?)
emacslike editing facilities (you can even cut text from editor and
execute it on commandline...).

I recommend editing Microemacs keybindings before using it. Keybindings
can be changed with kb command or using diskeditor (I prefer this method,
it gives me perverse pleasure to fiddle with program innards ;-).

I also would do some aliases and a script for d: (instead of cd d:) style
directory changes.

Gulam has one bug, if cp has only one parameter Gulam kick user back to
GEM (hasn't bothered me).

I do realise that ZIP style compression methods are useless for this sort
of thing and that delta comopression is probably the way to go. Trouble is
that I know very litlle about compression technique so I would need some
source code examples. Maybe even a lossy compression system like JPEG for
audio.

|> as fast (after all, it simply calls Line-A on some machines).

That's right, but how am I supposed to get information about the screen resolution for a program which needs to know this *before* the VDI has been initialized? Even the VDI takes its information from line-a. Point: The falcon seems to report strange numbers for getrez() (so I was told). Question: What can I do on the falcon to get information about screen things without asking the VDI and still being compatible with all other ST's? Shall I read registers from the shifter?

So why am i doing this ?...

shel_write(9, 1, 0, NULL, NULL); // inform AES that we understand AP_TERM

Why is the AES sending out messages to 'every running AES application'
including those that have not registered that they comprehend the message? i'll
have to try it without the shel_write to see if the AP_TERM still arrives.

Adam.

We did gain quite a bit of speed actually, because our screen system does not use any AES or VDI calls... Though that is being changed for the sake of newer machines with better resolutions, more colours, and faster processors.

From: gt1448b@prism.gatech.EDU
Message-ID: <146866@hydra.gatech.EDU>
Source record: 33662

One thing I've been curious about. I know that the FPU in a TT/Falcon runs as a coprocessor (FPU opcodes can be written directly in the program code). Does the FPU also support the peripheral interface found in the Mega ST/STE? (In other words, does code written to utilize a FPU in a ST/STE utilize the FPU in a TT/Falcon?)

[Author was Toni Woodward]
[Posted on Thu, 24 Mar 1994 08:09:36 GMT]

I am having problems transfering files between an Atari ST and a portfolio. I have Xterm2 on the portfolio and I am using vanterm on the ST. Can anyone offer any help. All I seem to get is a too many errors message on the ST.

Toni

Roger Sheppard (sheppard_r@kosmos.wcc.govt.nz) wrote:

RS>Hi, ICD uses a 3 second Boot Delay, is there any way I can turn this OFF..

You can. At least in my version of the 6.2.3 booter, look for the bytes
$06B900000258000071E4
^^^^
$0258 = 600 = 3 * 200 = 3 seconds delay.
Insert your favourite value here.

Has anyone figured out what the 'None/Unix/Tos' preference is on the
Falcon in the NVRAM settings yet? Has anyone tried attaching a unix
disk to a Falcon? Wonder what happens...

From: bobhays@spss.com
Message-ID: <bobhays-250394083314@haysmac.spss.com>
Source record: 33669

I tried this morning building one of the tests for the G++ compiler, and I got a lot of errors. I also had problems using make from a unixutil collection, so, my question is, is makefile.32 designed for use with GNU make (gmake)?

Thanks and have fun! - Bob

1637. Epson 1.44 drive - jumpers?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-25 18:30:00 UTC
From: bo.leuf@daggskim.ct.se
Message-ID: <2d932fbe@daggskim.ct.se>
Source record: 33670

For the past year I've been trying in vain to get the specs on the jumper positions for an Epson SMD-340 1.44 drive. Suppiers and service techies just shrug their shoulders, saying they have no idea as they don't have the info. Something is set wrong for Atari use, but what? Anyone?

Seen from behind, the settings as shipped are:

```
(power) o o o o o o=o o
( ) o o=o o=o o o o
```

(Oh well, perhaps academic question now. Just dropped the drive on the floor - might be ok, might not... Still, it would be nice to know.)

I just discovered something weird with the BlowUp demo. When I set
it to 40 columns and line doubling on in the 16 color mode, my screen size
stays at the 800 x 480 I set it to, but the system font uses the small
8 x 8 size, and all my window gadgets are small! I happen to like this a LOT
and am wondering, does the commercial and Hard versions keep this "feature"?

No!!!!!!!!! I pay child support for 3 kids already. I don't need another
kid to support!

>T0-day my ADspeed arived, it took 2 months to replace via
>Air-mail..

If you sent a check they waited until the funds cleared thats 2-3 weeks.
ICD's bank to mail your bank and your bank to mail to ICD's bank.

Money order; ICD's bank waits for your funds to clear 2-3 weeks.

I sent cash in sterling to UK for shareware, they sent the program
within 4 hours of receiving the letter but it still took 10 days
for my letter to get there and 10 to get to me once it was mailed.

>It only took 8 days from the USA to get to me, so how can it
>take some 6 weeks for them to replace it...
Perhaps they were waiting for new units to arrive.

I do know that they went to the Sacramento Atari Group EXPO
March 12-13, and they did not return to the office until 15 March.
I beleive Howard Peters is the only person who handles Atari
support at ICD.

>Plus I never recieved any replied to my E-Mails or Fax...

Send me the Internet address and I will try it to see if it is still in use.

>Not a good service do you think....???

I have had no problems with service but I am closer than you.

> ( ) o o=o o=o o o o

Try this:

9 o o o o o o-o o 16
|
1 o-o o o o o o o 8

1-2 The 2 M mode is set by the HDI input "HIGH" (ATARI).
2-3 LOW

4-5 The mode is switched by the internal sensor (DUMB-DOS).
5-13 HDI input (ATARI).

14-15 Drive Select 0
15-16 Drive Select 1

Hope that helps.

Bye,
Knarf

1644. Re: Latest GCC Libraries and headers!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-27 11:57:00 UTC
From: knarf@nasim.sta.sub.org
Message-ID: <2n3sac$9mv@nasim.sta.sub.org>
Source record: 33677

wtuart Denman (sdenman@wolf.cs.washington.edu) wrote:
> Could somebody please tell me where I can get the latest GCC GEM Libraries
> and header files in full? There are so many split up files at a.a.u.e, that I
> just want ONE file with all the stuff.
> If somebody could uuencode it to me, that would be great!

Get something like this:

-rw-r--r-- 1 knarf admin 210416 Feb 20 22:27 gemlib30.zoo
-rw-r--r-- 1 knarf admin 65896 Feb 20 22:27 gemolb30.zoo

The lib-file contains the Sources of the GEM-Library and the olb-file
contains the compiled libraries.

The include-files are included in the latest MiNT library PL44. They
are also in the latest GNU Library, but there is no need for them.

> Also, what's the difference between GEM.OLB and GEM16.OLB?

gem16.olb (NOT called GEM16.OLB) is for compiling with -mshort.
Otherwise use gem.olb.

> Also, why do a lot of the VDI routines take int's as parameters when the
> should be short, shouldn't they? According to the Atari Compendium, they
> should be WORD parameters, which is the same as short isn't it?

There is no standard how long a 'short' or an 'long' has to be. The
standard only says that a 'long' has to be longer than a 'short'.

If you compile with -mshort a 'int' should be 16 Bit:

-mshort: Consider type int to be 16 bits wide, like short int and
causes the macro __MSHORT__ to be defined. Using this option also
causes the library 'library16.olb' to be linked.

Bye,
Knarf

You need to patch it to take into account the exrta word on the stack frame.
Test the word in $59e == _longframe. If it is non zero then there has been an
extra word pushed on the stack.

1646. heirarchal menus question.

Message-ID: <1994Mar27.200859.10503@news.csuohio.edu>
Source record: 33679

Please don't tell me to get the atari compendium or developers docs. Neither is available at any library in the us, and I don't have enough money to buy them. I want to write popup menu routines which will be compatible with aes 3.3+. This is for my mint acc loader _lack_, and once it works, one will be able to load programs into acc slots. This will not give you pre-emptive multitasking of gem applications like multitos, however it has the potentional to be more stable than chameleon, multigem, et. al. under mint. Looking at gemlib pl30, I have no idea how popup menu's work. An object can have a submenu flag: Does the item which has a submenu attachted get this flag, or the box around the submenu items? Will menu_attach set this flag or should the user do it themself?
Also, what is the new format of shel_write? Will gemlib ever support multitos?

Thanks,
Jason

1647. Bigsreen Drivers

Hi Folks ,
Have a question here someone may have come across before.
(This is for a friends set-up). He is running a Moniterm 19" (194 Model)
high res mono screen on a Atari Mega. He has had some problems running
some applications on the big screen and was recommended to get a program
called "xmon" (Written by a Don Wheeler ?). This apparently centres any
programs to the screen allowing them to run like on a 14" screen. I've
tried to find the program on the ftp sites but as yet have been unable to
find it. Does anyone know of where I might find this program or any
similar programs which do the same thing (Preferably via ftp).
He has been running bigmon but it does not seem to work with
programs wanting to see a smaller monitor. Bigmon I think is an Atari
product?

Any info appreciated!

Cheers

David

Unfortunately your 'method' is completely alien to most users of
computer software, ie Macintosh, Windows, X Windows etc. When you Cut
something, it is *immediately* placed on the 'clipboard', which other
apps can use to paste from. It doesn't go into some intermediate
limbo, unless (as Warwick pointed out) the user is not interested in
transferring data between apps.

Perhaps you are missing the distinction between making a selection, and
cutting something?

Making life easier for the programmer is *not* the idea. Making life
easier for the user *is*.

1651. Hard drive problem 2

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-28 14:47:41 UTC
From: dbanarse@sees.bangor.ac.uk
Message-ID: <2n6qmd$b7q@clss3.bangor.ac.uk>
Source record: 33684

Thankyou to the people who have replied to my previous article
regarding my hard drive problems, namely Dave Foy, Brian Robson,
and Steve Woodford.

The power supply problem is being investigated at the moment (the
connections are alright but the supply might be waning)

I am currently trying to find a suitable driver though. The hard
drive did come with a BBDP Electronics driver (version 3.0) for
the XS1410 but when installed the drive starts to boot but then
crashes.

Does anyone know of any other Xebec S1410 (or ST506) drivers ?
Is writing a driver a pretty tough task ? - I am competent with C
but not too familiar with the workings of the ST itself !
Does any one have information on the Xebec controller or know
where I can contact Xebec ?
Failing that I might have to buy the ICD AdSCSI interface to
replace the BBDP board.
What are the differences between the ICD Link and the ICD AdSCSI ?
Lastly can anyone tell me the differences between ACSI, SASI, and
SCSI ?

all help is much appreciated !!
thanks a lot,

Dylan
dbanarse@sees.bangor.ac.uk

PS Please could replies be mailed to me (dbanarse@sees.bangor.ac.uk).
Unfortunately the news server here is quite unreliable.

>my MiNT Distribution Kit structure. If some kind sole would help me get
>my MiNT GNU C setup right, I would be glad to attempt the conversion.

I've ported C-Kermit 5A(189) to MiNT and it seems to work fine. The
only tricky part is getting the "connect" command to work, as it uses
two processes running concurrently, which is a pain since MiNT doesn't
yet have a non-blocking fork(). I used the tfork() function and a few
kludges to get it working under MiNT.

This version does support large packets and sliding windows, and seems
to give pretty good performance at high speeds (though I haven't
bothered to clock it and get an exact cps). I'll try to post it on
atari.archive within a few days.

-entropy

p.s. I don't use TOSWIN myself, but it runs under mgr, can't see how
TOSWIN would be a problem.

p.p.s. I'm not sure if 5A(189) is the latest and greatest kermit, if
there's a newer one out there let me know...

1654. Re: MIDI programming problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-28 18:16:55 UTC
From: hjv@phil.ruu.nl
Message-ID: <2n76un$jht@chico.staf.phil.ruu.nl>
Source record: 33685

jules@cs.ruu.nl (Jules Vleugels) writes:

> Is there a faster way to check and read the incoming MIDI data, or
> perhaps it is possible to enlarge the system buffer for incoming
> data?

Yes, you can install a new buffer quite easily:

```
#define BUFSIZE 1024

long *newbuf, *oldbuf;
int oldsiz;
/* .... */
oldbuf = Iorec(2)->ibuf;
oldsiz = Iorec(2)->ibufsiz;
if ((newbuf = (long *) malloc(BUFSIZE)) == NULL) {
fprintf(stderr, "Out of memory");
exit(-1);
}
/* from now on you can safely use the following 2 functions to install and
deinstall your custom buffer */

void new_buf( void )
{
Iorec(2)->ibuf = newbuf;
Iorec(2)->ibufsiz = BUFSIZE;
Iorec(2)->ibufhd = 0;
}

void old_buf( void )
{
Iorec(2)->ibuf = oldbuf;
Iorec(2)->ibufsiz = oldsiz;
iorec(2)->ibufhd = 0;
}
```

Be careful however: if your rogram exits (intended or not :-) while your
custom buffer is still installed, you will surely freeze the ST. Therefore
the safest approach is to install the custom buffer immediately before you
use it, and deinstall it immediately afterwards:

```
...
new_buf();
io_routine();
old_buf();
...
```

Hope this helps...

Indeed. Mosaic is not the only possible interface to the Web. A text-only
interface would be possible. And yes, SLIP would be fine for that.

But I agree - I know of none.

Other application windows DO show through the new installed desktop.
It's a pain to have new desktops though because in 640x400 (and
certainly smaller screens) it's nice to be able to close desktop
windows to save space and just double click a drive or folder to
reopen them.
Is anyone out there interested in writing a "Desktop Manager" program
which looks after various objects from different programs on a single
communal desktop? I've considered doing it in the past but never got
round to it (too many other ideas that never work ;-)
It could install it's desktop and accept new icons using the dragdrop
protocol (as well as other methods).

If anyone writes this could they tell me?

I don't understand this. How does using one VDI call to turn off the mouse
(plus a few others only at start-up/shut-down) loose quite a bit of speed?

The fact that your application doesn't make any other VDI calls is
irrelevant. It's not as if using the VDI for a one-off operation somehow
(by some voodoo effect) makes the whole of the rest of your application
slower. Or am I missing something? Does calling v_opnvwk() turn on some
sinister cycle-stealer?

1663. TRAP vectors don't STAY set!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-29 08:22:55 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar29.082255.2601@beaver.cs.washington.edu>
Source record: 33496

I'm having trouble getting the trap #2 vector (address 0x88) to stay
the way I set it. First, I set it to the address of my routine I want to run,
which bypasses to AES and VDI if it doesn't need to do anything.
The vector points to my routine until after I run a program from the desktop,
and then when I quit that program, the vector gets reset to what it was
before I set it with Setexc()...bios #5.

How do I get this to stay pointing to my routine all the time? Somehow the
OS is resetting the vector when a program terminates. I need to know how to
tell the OS that my vector is the new one.

Universal Item Selector and other programs seem to change the TRAP #2 vectors
without any trouble. They stay the same when you exit a program. You can
even run them from the desktop as well as from the AUTO folder for the same
effect.

Thanks for any help you can offer...

IMHO any sequencer worth using will bypass the OS for both MIDI input and output.
Even if you fixed the ACIA overruns and the TOS buffer overflows in some way
you won't get anything like stable timing or 192ppqn accuracy unless the
sequencer core is interrupt driven.

Top professional sequencers also do their own screen handling to
provide real time MIDI clock displays etc.

The situation is somewhat different with synth editors since only reliability
of data transmission is important, not timing.

The is a comercial DA called MIDIspy which may do what you are trying to do
but I have no idea of how it does it or what software it is compatible with.

Steven

Well I was talking about writing to the screen during an interrupt.
Naturally I only call Line-A once during initialization
to get address of the Line-A variable table and the system ROM fonts.

|> >Also there anyway of getting at the ROM system fonts other than than through
|> >lineA?

|> not playing about in ROMs and LineA.

A MIDI Sequencer with real time displays (the next version of EKSEQ1 to be
exact). This kind of program tends to be notoriously brittle and incompatible
with other hardware/software - when you're writing a real time app under a
non-real time OS you have to cheat...

|> You can use the VDI from within a TSR program. Just open a physical
|> workstation instead of a virtual workstation and then close it before the
|> program ends.

Does that mean before it does a terminate and stay resident call? For my
next MIDI program I'm considering putting all the nasty MIDI/real time stuff
into a TSR which will add real time facilities to TOS. This TSR will

grab loads of systems vectors and in particular I need a reliable way of grabbing the GEM vex vectors. Will open a physical workstation and then making the approriate vex calls be adequate? what about under NVDI?
Do the open/close physical workstation calls actually exist unless you load some version of GDOS?

Steven

1667. Hard disk problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-29 10:35:29 UTC
From: w.purvis@dl.ac.uk
Message-ID: <2n909h$qjb@mserv1.dl.ac.uk>
Source record: 33500

I have just acquired a hard disk from a machine that is being junked. The disk was working fine prior to being scrapped. I have also borrowed an ICD adaptor from a friend who no longer uses it. I put the two together and connected it to my STe (4 megs). I booted up the ICD utility disk and selected ICDFMT.PRG so as to re-format the disk for TOS, but the program reports 'no devices connected to scsi'. The controller appears to be working OK as when I boot up I get messages about hard disk driver being installed, cache sizes and Clock. The disk is a Priam 738 (never heard of it before either!) which I believe to be 300+ Mbytes. It spins up and do its initial seeks OK.

Can anyone make any suggestions as to what I might be doing wrong?

Bill

1668. Re: Floating point usage

Newsgroup: comp.sys.atari.st.tech

In <1994Mar23.125236.2532@bay.cc.kcl.ac.uk> sjg@phlim.ph.kcl.ac.uk (Simon Gornall) writes:

>Can anyone tell me how to use the floating point co-processor in gcc?
>I have a 68882 fitted which I'd love to use :-)

1. Compile with the -m68881 option (there's no -m68882 option, as
far as I understand it, the M68882 is faster than the M68881, but
has basically the same instruction set).
2. Make sure that the math-68881.h header is included when
__M68881__ is defined (the compiler driver defines this macro
when it is called with -m68881). math-68881.h (possibly called
MATH-688.H if you use the TOS file system) implements many math
functions as assembler inlines that call the FPU.
3. You have to recompile certain libraries with the -m68881
option (add this to the CFLAGS defined in the Makefile). This is
necessary even with OS interface libs that don't seem to need the
FPU, if the lib contains functions that return floating point
types. The most prominent example is the mintlib, which contains
the strtod() function. You need a special FPU version of such
libs because real types are returned in FPU registers when you
compile with -m68881. Your programs don't work if they expect a
value to be returned in an FPU register and the lib functions
that were linked to the program return the value in CPU
registers.

That's all I can think of now. I should add that this works for
me on my TT, but the Falcon should not behave significantly
differently with respect to using the FPU. Good luck and have
fun!

Says it all - anyone know of an ftp site with ready-to-print docs of bash and gem++ (by printable, I mean either <80 column text or PostScript that will print okay)? And, I need a man application to read all those neat man pages I've pulled down.

Aside: I tried to print the PostScript file from the bash distribution at a mirror of umich and it printed "very funny" (only some pages, overran the margins, etc.).

Thanks and have fun! - Bob

From: vosst@urz.unibas.ch
Message-ID: <1994Mar29.141536.43647@urz.unibas.ch>
Source record: 33503

hi everyone,
i seem to have some power supply trouble with my trusty old mega st. it has an internal maxtor 7245 scsi harddisk an a hi-density floppy drive. since i put in dave small's megatalk board (for use with spectre) i have been experiencing some strange stuff. first it went well for a few weeks. then, on a sunny afternoon (what was i doing inside, anyway?), the computer startet resetting itself whenever it accessed drive a: during the boot-up sequence. i let it sit for a while and tried again - same thing! it seemed as if the power supply's output was just not enough. i have never since got it to run again, so i took the megatalk board out. but i would like it all to work. now, here's what i want to know:

- is there a way of tuning up the mega st power supply in order for it to put out more juice?
- is it the hi-density floppy drive's fault?
- could my soldering on the harddisk controller (!) (i had to connect the 12v dc to scsi pin number xy for the icd micro st host adapter to work) have anything to do with it?
- what is the meaning of life?

please post replies here or e-mail them to me at vosst@urz.unibas.ch
thank you all for your endeavours,

toby

Source record: 33508

I made the program into an AUTO-folder TSR, and trap #2 seems to be staying set the way I set it. Someone suggested traping the bios Setexc() command as well so that you could just ignore any resettings anyone tried, but then someone could just write directly to 0x88, avoiding Setexc() and you wouldn't catch it.

I guess I'll stick with the TSR method...

I did check into packages to europe and found that it is pretty
expensive and takes 6-8 weeks by sea. Air is way too expensive.
Presumably since canada is connected by roads it shouldn't be to much
different from US shippment.

>someone could just write directly to 0x88, avoiding Setexc() and you wouldn't
>catch it.
>
I knew I wasn't making much sense in the mail I sent. Every
time the gem desktop starts or wakes up from running a program, it
directly sets the trap 2 vector. It then calls Setexc to set the
etv_critic vector. If a program steals the trap 2 vector, the proper
thing to do is also take trap 13. If setexc(101, ...) is called in
supervisor mode, you should set 0x404 to what the caller wants, put
your vector back into 0x88 and return. The only reason that your
program works from the auto folder is because some other program
steals your trap 2 vector and handles setexec(101, ...) appropriately.
If you move your program to the end of the auto folder, your problem
will return. Look for the trap 13 handler for UIS, warp 9 or anything
else that steals trap 2. My program has the following code, and does
not get unhooked from trap 2:

```
_trap_13:
btst #5, sp@ | called in super?
beq not_gem
tstw 0x59e
beqs 0f
movl sp@(12), d1 |call address
movl sp@(8), d0 |func and first arg
bras 1f
0: movl sp@(10), d1
movl sp@(6), d0
1: cmpl #0x50101, d0 | Setexc(101 ?
bnes not_gem
movw #1, _is_desk
movl #_gem + 12, 0x88 | the jmp instruction in my
| xbra struct
movl d1, 0x404
rte
```

I hope this is of some help,
Jason

PS I don't think that there is a way to stop all programs from
reseting your trap 2 vector. But then again, programs shouldn't do
this so it should not be a problem.

I have some data on the Priam 738 which may perhaps be of interest:

SCSI 329MB formatted
1225 cylinders
15 heads
RLL encoding
Transfer rate 10 MBits/s
Av. Access 20mS

>Can anyone make any suggestions as to what I might be doing wrong?

If the cable is OK, perhaps the drive is not terminated, and was working
in the previous machine while terminated externally. Perhaps it may
also be an idea to check that the ICD driver has not been set to 'skip'
the drive's SCSI ID, and run 'IDCHECK' to see if the SCSI address is
recognised...

Best Regards,
Brian

1680. Desktop resource trees!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-30 02:16:18 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar30.021618.11732@beaver.cs.washington.edu>
Source record: 33513

How do you obtain the address from GEM of the current desktop resource tree?
I know with AES version 4.0 and above, you can get it from wind_get(0, 14,...).
It would also have to point to the new desktop tree when a program replaced it
by using wind_set(0,14,...).

Thanks!

1682. NVDI Help

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-30 04:32:02 UTC
From: tekmar@oar.net
Message-ID: <2navc2$7tn@dialup.oar.net>
Source record: 33515

Everyone,

Im having a very wierd problem with my TT system running NVDI/ET 4000. Im hoping someone out there on the net can help me out! The problem is as follows.

When I have NVDI/ET4000 loaded all of the software I have that plays MOD files (Desk Tracker, Juke Box, Paula, etc) work fine until I move the mouse around (so I can't close Paula down and listen to a MOD while I do something else). When I move the mouse around enough the system bombs (usually address error). Ive set up a boot disk with only NVDI/ET 4000 and Paula and booted from that disk and it still bombs. I can boot the system using the base Crazy Dots software and not have any bombs, only problem is I don't have the screen acceleration NVDI gives me.

I had this problem on my Mega STE system, and figured it would go away when I put the Crazy Dots II card in my TT. Unhappily it did not.

Ive also had similiar problems with Aladdin in that it bombs out if Im capturing messages and move the mouse. I also had a program I wrote for my Mega STE that let me use a IBM serial mouse in one of the extra serial ports of the Mega STE/TT. It worked great until I moved up to the NVDI software. Again, it bombs after a little while. It seems to be a common factor that all these problems are related to the mouse. Im wondering if the NVDI code is faulty and is doing something it shouldn't be doing when it comes to handling mouse packets.

I have tried every combination of ST Ram/TT Ram, NVDI settings (Line-A, mouse accel,GDOS,etc) and nothing seems to make a difference.

Anyone have any ideas on what could be going on? Im beginning to think I might have a bad copy of NVDI ET/4000 (ordered it from Gribnif).

If anyone has any solutions, please drop them to me in email. I dont frequent this group as often as I would like.

Please send replies to the following email address as I know I will receive it!

>very slow...

Too dear? my buy price on the IDE adapter (and that's not as a dealer) was
a smidgin under A$100.00, INCLUDING FREIGHT.

The last price I was quoted on an ICD link here was about twice that, and
the sucker who ordered it is _still_ waiting for it (and he handed over
the cash in December).

As far as 'slow' is concerned, I don't think so. In fact, I know so.
A megaST2 is not going to be able to stress any modern drive, IDE or SCSI
anywhere _near_ its limits - on the ST2 I just did I was getting over 700K/sec
with the somewhat bogus AHDI 6.x (HuSHi 4.07 had some problems with his
laserprinter - I understand that's long fixed.)

>Plus there is No Mail order in Germany, I have been there done that...

Well, I sure as hell didn't swim there you know. Wonder how it got here?

>Try and use a MasterCard in Germany.....

How about a bank cheque? cost me _six_ dollars - big spender.

>The ICD Micro Host adapter is very simple to fit, fits over the Roms in a Maga
>ST, it also has a built in Boot delay so that the hard drive can come up to
>speed, and I would rate it some 200%....

You can't plug Tos 2.06 into it, and we know _all_ about your ratings 8)

>(150MB).

There's a bug in the Tapebios driver - it doesn't correctly handle the long
stackframe generated by the 68030.

If you have to use it, get the source and look at the exception handlers.

As far as I can remember, one of them reaches back into the stack to frob
some stuff - without the source handy I can't give you more information
I'm sorry. I know that with this patched, it ran _fine_ on my TT.

If you're desperate, mail me the source for the driver and I'll mail you
back the section you have to patch. (I might even be nice and give you details
for patching the binary if you don't have gas 8)

> - what is the meaning of life?

Your power supply is probably toast. Without getting into the specific
things you did, in general hooking more things up tends to take out the
wimpy atari pwer supplies. The symptoms strongly suggest a power
supply that just doesn't have what it takes any more. Repairs will not
last. Call toad and get a new (non-atari) one.

Life sucks, then you die.

1692. HELP! Directory deleted! *&$#*&

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-30 12:58:52 UTC
From: hjv@phil.ruu.nl
Message-ID: <2nbt2c$l58@chico.staf.phil.ruu.nl>
Source record: 33523

Yeah, well, the subjectline sez it all in fact...
I had been working on a programming project for 2 weeks, when suddenly
a nameless file appeared (just a bunch of blanks as filename). Upon
inspection this appeared to be a copy of one of my sourcefiles, so I
thought I might as well delete it.
Dragged the thing to the trashcan -- and the machine starts deleting
the COMPLETE directory !!! *&$^^#
Problems:
1. Two weeks of work is gone (no, I didn't have a backup -- flame me)
2. Both FAT's are not identical
3. The files weren't contiguous

Solution:
Ask you guys out there what I should do...
Is there a good undelete-program -- preferably one that is able to track down
non-contiguous deleted files, and one that lets you save the undeleted file
on _another_ partition (just for safety)? Preferably PD/shareware/freeware.
Any suggestions, hints, tips and tricks?
I'm really desperate so *any* reaction or suggestion is more than welcome.

Email and follow-up are both ok with me...

Geesh, there are days when I simply *hate* those machines...

P.S. does anybody have any idea as to what *caused* the problem in the first
place? I've never seen anything like this...

Thanks in advance for any and all help.

I have a copy of Lattice C v5.06.02 and have noticed that the source forthe mintlibs contains a lattice folder. I tried to create the libs but have had no success. Up until now I used GCC for writing mint programs, but libs for lattice would really be nice.I know the latest version of Lattice C has its mint libs but I cannot afford to upgrade.

Anyone got any help...maybe you could send me the libs?

1695. Help w/flaky 1040ST!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-30 15:27:27 UTC
From: dud@cbnewsf.cb.att.com
Message-ID: <CnHHLs.6nr@cbfsb.cb.att.com>
Source record: 33526

Help! I've got a very early vintage 520ST that I upgraded a year ago to 4Meg of ram by hacking in 4 1Mx9 SIMMs, and I got an ICD adapter from somebody on the net, and stuck an 80MB drive on there, and I've got Mint and GCC and Sozoban and a whole bunch of stuff on there that I fool around with when I need a break from real work. I've got TOS 1.4 ROMS.

And now the hardware has gone flaky! Symptom is that I can't boot successfully from either floppy or hard disk. I get 2 or 3 or some large number (10? 12? I didn't count) of bombs. With the ICD unplugged and just a floppy attached, sometimes it gets as far as putting up the desktop and then crashes, but mostly it crashes before it even gets that far.

I've unplugged and re-inserted the various ic's, since I know the sockets on Atari's are notoriously flaky, and that hasn't helped.

How do I track this down?

Is one of the plcc devices more likely to fail than another?

How can I test memory if I can't boot to run the memory test software?

Or have the sockets just finally died completely?

I'm an experienced electrical engineer with a decent oscilloscope at home, so you needn't "dumb down" the discussion for J. Random Luser.

1698. EMACS Installation Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-30 19:12:35 UTC
From: pstoaks@spider.mentorg.com
Message-ID: <2nciv3$fft@hpbab.mentorg.com>
Source record: 33529

I recently downloaded the EMACS archive from atari.umich
and am having a problem getting it installed. I have
carefully followed the directions in the accompanying
documentation. The setup looks like:

```
EMACSLOADPATH=g:\emacs\e-bin
EMACSLIB=g:\emacs\e-lisp
EMACSDOC=g:\emacs\e-etc
UNIXMODE=/.,rDLAHdb
HOME=d:\cc\work
```

The command line .\temacs -batch -l loadup.el dump
results in the error "Unable to open load file loadup.el"
(or something of that sort) whether the command is
initiated by dumpemac or directly issued to the shell.

Changing the command line to:
.\temacs -batch -l $EMACSLIB\loadup.el dump
results in loadup.el being loaded correctly, but the
first load operation within loadup.el fails with the
previously mentioned error message.

I have tried many permutations of UNIXMODE settings,
as well as Unix-type environment variable settings to
no avail. Changing EMACSLIB to a bogus location results
in the correct error message "Emacs library (bogus path)
does not exist." (my paraphrase, because I don't have
a photographic memory.)

The specific file I downloaded is 1858b-d3.zoo.

Anybody know what is going on?

No, I'm not "Wrong again"

10am in IL,USA is 4am NZST , 4am is economy.
(Note:I think they switch into DST at 1am this Sunday, so that will
make 10am there 5am here)

Ecomony is 10pm to 8am, so if you called just before 8am, it would be
just before 2pm there (3pm next week).

When you called at 6am, it would have been 12pm there... maybe they
all went off to lunch and left an answering machine on??? Try ringing
a bit earlier or later.
Oh, and don't bother calling on a Monday, it's Sunday there.

>By the way you prices don't include GST, gee were did you go to school..???

I went to school here in Christchurch, New Zealand.... I guess they
taught you differently in the uk? Assuming that's where you're from?

I'll Quote from the Clear Residential rates book.... "International
rates are quoted in dollars per minute (GST inclusive).

And in the Telecom rates book, it's got 2 columns , one says GST Incl, the
other GST Excl, I quoted the rates from the GST Incl column.

>Plus there is no Clear here on the Gold Coast....

So you're paying 1 or 2 cents a minute more through Telecom... no great loss.

Craig.

A sound module (mod file) contains up to 31 sampled instruments, and
sequencing information to play them. They are not direct samples of
music. Grab a good tracker and some mods (I suggest Protracker ST 2.0),
and watch the module information stream by to get a better idea of what is
going on. You can also play and see the individual samples.

1703. MEGA ST UPGRADE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-31 02:04:24 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <2ndb38$nvu@golem.wcc.govt.nz>
Source record: 33534
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well at last I have a upgraded Mega ST 2...

I brought the Mega just befor Xmas as I wanted a machine
with Overscan and a Built in Hard Drive, Falcons/Mega ST
and TT are far to dear here...

I had all ready ordered the ADspeed and Micro Host adapters
made by ICD from a friend, he was send a flyer stating
that these were on sale, $39us for the Micro Host and
$99 for the ST ADspeed..

They took a bit of time to get here, but then I did not have
my Mega yet..

Well I did not fully test the Mega, it looked OK and when I run it..

Well as soon as I recieved the these upgraded bit I fitted them
all to the Mega, the Overscan was the only problem, were to fit it,
well I found a place just above the CPU, also the ADspedd cut trace link
that was mentioned for the blitter patch was not needed, the 68000 CPU
had the IC leg lifted out from the PCB...

I did a small mod, to the PSU as the 5 volts was low, no adjustment on this
version, its set by 2 fixed resitors, so I just shunted one to bring it
up to 5 volts...

Well after it was all together it seem to run for 8 hours them crash on me,
the Neodesk could not find its resource file,?? I would copy a new one and all
would run again till I rebooted..??

Well it finally gave up, so out came the ADspeed and the Hard Drive, patched
out the Overscan mod also the New TOS 1.04 Roms that I had fitted, still no
joy.

Well out came my trusted 1740A HP scope, and found a short in one of the Ram
chips, as I could not get Nmos Rams any more I replaced it with a Cmos one,
this was then tested for a day with the Supra memory test program, all was
ok..!

Replaced the ADspeed, but that would fail after 8 mins, this was finally
returned to ICD, a replacement came back after a 2 months delay..

Every thing was reassembled, and has now been working for some 4 days now,
the only other problem is the ADSPEED.PRG, it looks like it has some Bugs,
this has been mentioned by ICD, TEMPUS II will crash after 20 seconds..

The ADspeed is very nice and well made product and so is the Micro Host adapter, its a pitty that they are no longer made, but I think they still have stock left..

So why not give that old Mega a new lease on life and fit these upgrades, well worth it..

If any one needs any help about these upgrades Please E-Mail me....

PS. The ST_FORMAT free copy of Arabesque Pro does not like Overscan, but that was version 2.14 and I know there is a later version 2.15....

[...stuff deleted...]

Roger, you will find that many older programs do not work with Overscan r
ADspeed. Many programs assume a fixed screen size and others (Tempus) rely
on the CPU timing for some operation (some blitting in Tempus, but I'm not
sure). These are all bad practices, but were common to optimise speed.

You can change the ADSpeed frequency by poking the registers:

```
-------+-----+-----------------------------------------------------+----------
###############ADSPEED Configuration registers ###########
-------+-----+-----------------------------------------------------+----------
$F00000|byte |Switch to 16 Mhz |W
$F10000|byte |Switch to 8 Mhz |W
$F20000|byte |Turn on high speed ROM option in 16 Mhz |W
$F30000|byte |Turn off high speed ROM option |W
$F40000|byte |Unknown |W
$F50000|byte |Turn off cache while in 16 Mhz |W
| | >> Write 0 to an address to set it. << |
```

I had a similar problem, loads of bombs, was caused by bad connection on a Marpet SIMM board. Maybe one of your wires has come loose?. The only way I could debug the problem was to take a logic probe & inspect each pin on the SIMMs.
When I found a pin that was not toggling or set high/low, I then checked the connection back to the DRAM controller with a DVM. If it was o/c or high resistance I resoldered it.

Hope this helps.

1706. OVERSCAN problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-03-31 09:08:11 UTC
From: jaszcz@donald.EEAP.CWRU.Edu
Message-ID: <2ne3tr$52l@usenet.INS.CWRU.Edu>
Source record: 33537

i'm trying to modify my mega to the overscan (wired version...)...

i hooked up everything like in the docs, but there seems to be a problem...

I switch to overscan, then reboot.. the HD seems to load its driver and
then the ST hangs... it boots fine when the switch isn't in overscan...
any ideas??

Reading the group, I think I heard mentioned that the 68010 and 68000
are pin compatible, and that the 68010 could increase speed by 10%.
I also remember hearing mentioned that a "patch" program is needed
for everything to work right (and TOS 2.06).

My question is: is there any documentation on how to do the whole
project? Like where to get a (preferably 16mhz) 68010 and price on it,
what patch program to use, etc. I intend to try this on my
16mhz MegaSTe (TOS 2.06) if possible. Thanks for any pointers...

Hi.
We're trying to get two Mega STe 4's connected through their
'Lan port's. So far, a student has managed to get the SCC working
in local loopback, but not to the outside. Has anyone any
experience with this?

Greetings, Bert

Right -- NCSA provides the source for a HTML widget (i.e. X windows widget).
It shouldn't be very hard to port that to the ST and add a wrapper for
loading HTML etc.

Hi there,

You've got to hand it to the author of UPOINT: he's a clever bastard.
Last december he launched his UUCP point package - a PD version which
could be upgraded into a somewhat larger 'medium' version - shareware.
The package itself is by far the most clever UUCP mailing utility on
any platform: small, friendly, fast.
You cast aside all the other UUCP stuff you have and you expose
yourself to UPOINT's uncanny slickness. Then april comes, you know,
april first .. and suddenly UPOINT is no more. Well, it's still
there, but you can't access it any more. You disconnect your system,
dismantle your modem, all the other stuff still works fine and then
you find UPOINT on your other computer also passed away..

narrowing eyes

Fair enough, good joke. But why wasn't UPOINT light released as just a
DEMO with a mystery restriction?

(had to set back the clock to write this one - it's march 31 and
all's quiet on the western front..)

Paul :/

It might be better to port the tk/tcl package. Then we could use the tkWWW browser , as well as many other tk/tcl based programs. This is also a very nice tool for building new applications, which is catching on like wildfile in the Unix community. It happens to use Xwindows there, but I don't see why it cannot be implemented on top of GEM (if that has not already been done).

>can't delete them or change the names or copy. I'm not sure where to start to
>fix this.

This is a bug in older TOSs. What happens is that when you access a directory,
some memory is put aside. This happens everytime you access a directory. When
you leave the directory, that amount of memory is supposed to be freed, but due
to the bug, this does not happen, and you are left with the warning dialogue
box 8*((

Anyway, help is at hand, with a patch by Atari themselves, and it is
free....you can find it on ftp sites, or PD libraries (what are those....evcer
since I've been ftp'ing...never seem to use those). The program is called
folderxxx.prg, and it is placed in the Auto folder.

Hope this helps.....and oh, you guys out there, if any of this is wrong, please
don't flame me. However, do inform me of what is wrong.

Thanx

Danny

I have seen the original ST Logo and BASIC advertised as available
from PD/Shareware disk distributors. Also I think I saw the original
control panel and VT 52 accessories available on atari.archive. Does
anyone know what the real status of these formerly distributed with
STs and now unsupported programs is?

> movl #_gem + 12, 0x88 | the jmp instruction in my
> | xbra struct
> movl d1, 0x404

> rte

I see two problems with this approach:

1: You should do something like
movea.l _oldtrap13,a0
jmp (a0)
instead of simply stuffing the new vector into 0x404...
Otherwise other TSRs that grabbed the trap 13 vector before you
did (probably for the same reason you did) will *never* "see" the
Setexc() call!

(Besides, you forgot to handle a special case: if the new vector
is _negative_, Setexc() will only return the old value and not
modify the vector at all; calling the "real" Setexc() at the end
would fix this bug, too!)

2: Simply overwriting the AES trap vector with the address of your
routine is a little drastic - suppose another TSR installed itself
in the meantime?

I think it's *much* better to do the following:
- Examine the AES vector's XBRA chain (if present) wether your TSR
is still installed (this could happen if Setexc() was not called
by the AES but by a shell/user program/other TSR)
- If your TSR didn't find itself, save the current value of the
trap vector in the "next" field of your XBRA structure and
then overwrite the vector with the address of your handler.

BTW: if MiNT is used, your TSR should be loaded *after* MiNT; otherwise
the "called in super" check won't work...

I have been experimenting with Mint on my stock MEGA-2 ST (not STe) and
have come to the conclusion that I need more memory and speed, so I need
answers to the following. BTW - I am using TOS 1.04

1. What is the easiest and safest DIY (Do It Yourself) method of upgrading
to 4 meg of RAM? Could someone please send me the specifics including
a source for the chips?

2. What options do I have for increasing processor speed? I am running at
8 MHz with a 68000 CPU. Compatability with older programs like Flash
and WordPerfect is important as well as MIDI programs (I use SmpteTrack
which is suppossed recognize faster clocks, but other progs might not.)
Something that has a physical switch for the clocks would be ideal.

If you have any information that might help me, please send email to:

vcross@genie.geis.com
(the bnr.ca address will bounce, so don't mail me there)

Thanks,
Vince
